Shure you replace your memory board 1:1 to the memory port on mainboard?
It sounds (for me) as not.

Combel chip includes some error force routines, the point you get a
white screen only. Something (COBEL include) can be broken.

BEST method to force that problem is to get some answers
from an falcon testkit.

Regards, Robert

Hi,

> I am running an Atari 1040st with 1 meg ram, a color monitor, and a Jaz 2 gig drive through ICD's "The Link" SCSI interface. What I need is a memory cost-effective way to emulate a monochrome screen on my Atari, have it be perfectably readable, and not use up a lot of memory. Preferable a solution that maps a mono screen onto a medium res monitor so that I can scroll about. If anyone has suggestions, please e-mail me. Thanks.

Have you tried SeBra? It offers several emulation modes, including scrolling med-res.

From: nospam@telebyte.nl
Message-ID: <Pine.MNT.4.31.0203010949240.123-100000@easymint>
Source record: 37357

I just got my update from Score Perfect Pro 3.2 to 4.0, which is unfortunately the final and not anymore supported Atari version of this very good music scoring program.

Both in my 3.2 and 4.0 versions the "outlined" or "umrandet" (in German) fontselection has mysteriously disappeared from the menu. But my old SPP score files that contain such a font (especially nice for TITLE text) are still shown correctly with an outlined font !!??

Any SPP users here who have noticed this too ?

Another thing: SPP doesn't like my CT2b. The graphics get completely corrupted, the noteheads are not round but square, and many buttons are completely black. With the turbo switched off all is OK.

That's a shame - but please chuck that paper in the bin and use a UV
lightbox (you can make one very easily) with transparency film and coated
PCBs when you return to this project. You're wasting your time with that
stuff, believe me.

Blimey is slang for ' Blind me '.....

Your point? £149 is for new packages, I do have used one
for less.

Q. Have you seen the London price?
Q. Do you actually use Cubase? Genuine or stolen?
Q. What efforts do you make to support and maintain the
Atari?
Q. Are you just one of the price whingers?
Q. Do I really care about your opinion?

Also, I post my name, you hide behind a nom de plume......

Barrie at Keychange.

I agree with both of you. But the thing is Cubase is not supported anymore.
At all. Steinberg will not even reply to Cubase-Atari related emails
anymore.
That is why the price may seem a bit high for some.
Personally, I think it is pretty cheap if you think about the power of the
program.

That would be my question also. The Amiga was better in graphic
cabability and sound. With the coming of the STe, that closed the gap
significantly. The ST always has and still is superior in ease of use,
MIDI and stability. The ST monitors are better also. Both computers are
great and both have their high and low points. Now the subject should
be dropped.

Has anyone tried to use this device to connect to the ST/TT/FALCON?

http://www.embeddedethernet.com/

The chip that they use is the CS8900A:

http://www.crystal.com/pubs/cs8900a-4.pdf?DocumentID=532

I believe that this chip has two modes, one is direct connect to
an ISA bus. Maybe this chip could be used to make a board
specifically for the atari.

Richard Stevens wrote:
>
> Does anyone have or know where I can get hold of a ROM Port Adapter
> to allow me to connect a D-Link Parallel port Ethernet card?

Think you'll have to make one yourself... plans and detailed info is available
here :
http://gallery.uunet.be/saka/atari/ethernet/dlink.htm

Also, there are no drivers for any common tcp-ip stack (i.e. Sting or
Mintnet/magicnet) available, only for TUWTCPIP.

If you have an asci-port on your atari consider once thee acsi<->ethernet
solution. more info here :
http://gallery.uunet.be/saka/atari/ethernet/ethernea.htm
Think Elmar has prefabricated boards. Don't know if they're in production yet.

If you can wait a little, then wait and see the new ROM-port adaptors that
will be available in the future.

Hope this helps...

Howdy,

> But you seem to mean an Ethernet solution for Atari... A harder question
> to answer is how to get the Ethernet adapters.

I thaught the TT had an ACSI port. Please correct me if I'm wrong.
You should contact Elmar Hilgart once. Thaught he released his ACSI Ethernet
Adapter II and Sting drivers for that should be available.

Otherwise you can always try the ACSI<->ISA Ethernet solution also. But then
you need an NE2000 compatible ISA Ethernet card.

More info on these pages :

http://gallery.uunet.be/saka/atari/ethernet/ethernea.htm
http://www.asamnet.de/~hilgarte/acsi2ether2.htm

Yes, let me correct the statement I made in an earlier mail...
It is part of the FreeMint 1.15.12 pakage and can also be found here :

ftp://chapelie.rma.ac.be/atari/mint/kernel/freemint-1.15.12/

Nevertheless... if you can find a DE600 then you're a lucky guy... searched
for one 5 years ago and couldn't find one...

Greets,

Hi,
I am desperately looking for an old program called Art4Kids
(Art For Kids) - a TT version. It was available in three
versions: one for STE, one for Falcon and one for TT.
I have the Falcon version, but it does not work on TT :-(

I would be very grateful if someone could send me a working
copy of the TT version, or could sell me an original one (for
a reasonably low price, please......)

They answer my emails.

This turkey has more lives than a cat. What more support
does Cubase on the Atari need?

Genuine packages work, full stop.

It and Notator are in constant use world-wide making a lot
of money for a lot of people.

> That is why the price may seem a bit high for some.

No. They just want a very good piece of software for
nothing. They care nowt for the programmers or the users who
origionally paid several hundred pounds for it. Greedy
***s.

> Personally, I think it is pretty cheap if you think about
the power of the program.

Correct.

Next....

Hi,

I have an Atari SH024 hard drive unit, but no cable to connect it to my STE.
Does anyone know where I can get one? (in the UK) and for how much?

Thanks,

-Bill.

I actually found one pretty easy, but I had it sitting around for ages
without making the adapter. Making a good PCB was too difficult and
expensive for an amateur like me. I traded the D-Link for a 2.5" disk
IIRC.

I think so- e.g. shbuf_13.lzh in the pub/atari section at ftp.cs.tu-berlin.de
Did not try that because I changed the TOS image as you said above, so I do not know the details.

>> There is also a limitation to the number
>> of icons that can be placed on the desktop
>[...]
>What's the name of this patch? Anyone know more about this as it would
>be useful for the user-guide?

AFAIK it exists only as a patch for changing the TOS image (in the utility that was mentioned here several times). The 2nd internal resource file of TOS has to be changed (form #11). It is described under NEWDESK/RSC patch in the command file for that utility. I suspect that this patch is meaningful only in rare situation when TOS 2.06 rus on a machine with a larger-than-standard screen resolution (an emulator perhaps?)

> one recipe out ?? If so, what is the best ACC for the Atari and where
> can I D/L it ??

I would recommend Imagecopy. This is a commercial picture viewer/converter
that also enables you to hit ALT-HELP (the old GEM print screen combo)
that then gives you the chance to rubber band select a section of the
screen after which if you press Return will then ask you to save the
picture. Typically a .gif format file.

However as I said this is commercial software and I don't think it is
available for download. And AFAIK it is no longer sold as new.

Cheers!

James

Hi all!

Can anyone tell me how to turn on the Blitter on my Falcon?

Profile2 tells me that I have one but that it is turned off. Someone at the Cheshunt Computer Club thinks that MagiC turns it off for some reason.

I seem to remember from my days of having an ST that the General.CPX had an option for it, but the space for it when run on a Falcon has the CPU Cache button instead.

If I can turn it on, would there possibly be a problem with MagiC having it on?

Cheers!

James

One thing to bear in mind is that only the MiNT-net ovl and Dan's ovl
are still maintained. The rest included the original Iconnect ovl are
dead. The Booklage ovl can't even handle Cookies.

IMHO, the MiNT-net ovl is the best.

CU,
Martin

i know that when i've got nvdi installed (err like all the time!) then
this will automattically turn off the blitter.. maybe it's faster
without it?? Dunno about MagiC tho...
Even so, there'll be no problem turning it back on whatever the OS
you're using. I use Gem with NVDI and mine is always off at startup!
I simply use a cpx CP to turn the blitter back on. Check out any decent
web or ftp sites, but i'll email you mine if you like.

From: Kenneth Medin <kennethm@tripnet.se>
Message-ID: <3c80c7303ce571@tripnet.se>
Source record: 37301

Right now I'm sitting here on an Amiga show writing this with my poor Atari... Unfortunately I have not yet seen any darklings here :-) A pity, specially since we are located very near to the Gï¿½ta ï¿½lv river here in Gothenburg.

Anyway, the Swedish Atari Club SAK is here with a TT, Hades, Falcon, Stacy and a Jaguar on display. Add to that a PC running MagicPC and my little Cassiopeia WinCE, all connected via tcp/ip and the setup is quite complete. Well the Jaguar is offline right now...

There is a webcame here somewhere but I don't think we will be on display. The address is http://www.weemeet.net/wwwamigbgcom/live/ and the show will end 3 1/2 hours from now.

All Amiga people are very nice and interested in our stuff. So, there have been now fights yet :-)

Slightly different topic: I have tried several times to get a registered version of CAB 2.8. I was willing to buy it (via ACN, the dutch distributor for lots of Atari stuff) but after several phonecalls and e-mails they still haven't been able to get their hands on it. Now I'm getting my money back from them and have to keep working with the demo version. (With demo startup delay, no Hotlist, and limited access to the Modules :-( ). Unless someone knows how I can get a fully working version. I do have a registered version of 2.7.

I have heard this too, it is probably quicker for NVDI and Magic (which contains parts of NVDI I think) to do screen draws, etc with the CPU rather than the Blitter. As to why it is turned off; may just be a setting in software (i.e. I will or will not use the Blitter) or if it is actually switched off then it may save some bandwidth on the BUS (much like turning the Videl chip to a lower res), this is of course speculation rather than fact.

Elliot...

Hi Dude

| Can anyone tell me how to turn on the Blitter on my Falcon?

Ive been here before, i didnt think the Falc had a blitter!.

| Profile2 tells me that I have one but that it is turned off. Someone at
| the Cheshunt Computer Club thinks that MagiC turns it off for some reason.

Profile is a piece of shitte, there's that APP by that french geezer wots
much more intensive, and works in any resolution.

| I seem to remember from my days of having an ST that the General.CPX had
| an option for it, but the space for it when run on a Falcon has the CPU
| Cache button instead.

Thats correct, the button switches on if a blitter is present, and if its
not lit!!..

| If I can turn it on, would there possibly be a problem with MagiC having
| it on?

My Blitter is on, with the PAK, NVDI and Magic.

I'm having some weird problems with the internal HD (42MB Conner) of my Stacy 4.
In the past, I had some problems booting from that disk, because (my fault) I installed two different HD drivers on it (Atari's AHDI and ICD driver). As I wanted to save the data written on that HD, I disassembled the Stacy (a daunting task), and put that disk on an ICD external box with DME-SCSI interface, connected to a Mega STE 4. I successfully made the back-up of all the data of the Stacy's HD and then I reformatted it with Atari AHDI.
Unfortunately, when I put the HD back inside the Stacy, it is not recognized anymore by the computer. Even running ICD's "ID Check" doesn't show any unit connected.
Putting the same disk on the ICD SCSI box, it works. Putting it inside the Mega STE, it does not, as it happens inside the Stacy.
When I put the Mega STE 48MB HD inside the Stacy (too big to close the lid), that disk works, so Stacy's SCSI interface works.
I have tried to change the SCSI ID of the 42MB Conner disk, and to add the three small 8-pin terminators (taking them from Mega STE's HD), but it still doesn't work.
I've also tried to put a Quantum 80MB SCSI drive inside the Stacy, but - again - it is not recognized.

Does anybody have a suggestion to make that ��%�@ Conner HD (or any other SCSI HD that could fit) working again inside my Stacy?

Thanks for your help!

Back when I was first using ST's a common method of upgrading was to piggy-back DRAMs on top of the existing DRAMs. I'm sure there were some other little connections that had to be made on the board, though, and I can't tell you how that was done. You may want to check out ST Hardware Hacks at http://vezz.freeweb.supereva.it/ . He has instructions on a variety of RAM upgrades.

>Computers act weird sometimes!

I maybe should have added my own experiments to the above official
instructions:-

- 1. Make sure the hard-disk spins down to silence and then wait some, so
that the memory can drain completely. Go make coffee or have a p.
- 2. On the Hades, I sometimes had to hold down SH+ALT+CTRL.
- 3. ....
- 4. Er,... I think to shorten the interval before boot-up starts.

>First I could only get it to work if I did it like this:
>
>1) Make sure the floppy disk is inserted in the drive.
>2) Reset the machine (or turn on the power)
>3) (If power has been turned on or a cold-boot has been initiated) press
>any key, immediately followed by pressing (and keep holding down) the
><Alternate> key

- Well, pressing the ALT is the same as pressing any key.

> or...
>(after a warm-reboot) press (and keep holding down) the <Alternate> key.

- This never works for me, because (I presume) the memory still holds
the hard-disk info.

>4) The disk drive LED will light up
>5) After a short while you will hear the disk drive starting to read
>what's on the floppy. Immediately let go of the <Alternate> key.
- Yes.

>But now it works even though I keep holding down <Alternate> all the
>time through the boot process. Strange!
- Yes, this too.

Bonsoir tous,

Can anyone tell me how to turn on the Blitter on my Falcon?

I can't and I'm sorry that you can't do that from the desktop !

But some words about the blitter...
This chip don't have a lot of functions but do them quite fast. It maybe used for the screen but can be used by software for other purposes, and NVDI use it a lot and that's why it is so fast. That's you can't use the blitter with that accelerator.

Regards

Something a lot of Atari users could use, IMHO, are updated printer drivers. I'd think many Atarians would benefit from the ability to print Photo Quality images. The best choice would be NVDI,s stuff, since it is a standard. Perhaps the maintainers of Calumus, Photo Tip, Smurf, Aniplay and others would be interested in this? I'd expect it is possible, at least with machines able to run in true color. Is the number of colors an Atari able to run even an issue?
Wayne.

I have a general.cpx that has buttons for both Cache and Blitter. I also
have a little program called fcontrol (.acc or .app). I like this one
beacuse it's so simple. It has buttons to switch on/off Falcon's keyklick,
loudspeaker, blitter, and cache, and that's about it.

Just what is it you are asking for? The last time this topic
came up here, it was concluded, I think, that Photo Quality was in fact
edge enhancement, which Calamus does with either Starscreening or
FM filtering. Epson literature shows photo quality output to a 720 dpi
printer. At least, that is what they call it.

Further beating on the greasy stain where the dead horse used to be, one
might note that an old version of Calamus came with a printer driver
generator, and that can still be used. The problem is the printers, and
money is the solution to that. Getting the printer commands for the latest
printer from the manufacturer, after you find out which division sells it,
means buying the same 200 page book you bought last year, with four new
pages at the end, and I did not do that last year or this year.

To make things even more complicated, there is fVDI, too.

So, is what we need already somewhat available, saving and printing from
Calamus, or is is something else?

Of course, having had Calamus for years, I just cannot conceive of anyone
not having it, but it is more than a bit pricy for new purchase. I do not
know if the light version will run the now-free lower-resolution
StarScreening module, or the filter module with FM filtering.

M�gamodeste <yves.rogne@free.fr> wrote:
>Bonsoir tous,
>
>Can anyone tell me how to turn on the Blitter on my Falcon?

The blitter chip is never really turned off. It is just not used by
NVDI (or fVDI for that matter). IIRC, the original VDI on the Falcon
had no software equivalent to the stuff it used the blitter for, and
it was therefore impossible to 'turn it off'.

>I can't and I'm sorry that you can't do that from the desktop !

You shouldn't be. You're generally better off without using the
blitter (as long as you have a decent VDI).

>This chip don't have a lot of functions but do them quite fast. It maybe used

The Atari blitter only does blits (block image transfers), with simple
logical operations between source and destination. It might have been
somewhat useful in the old 68000 machines, but even the 16 MHz '030 in
a standard Falcon is able to keep up with it (and since there is no
setup overhead when using the CPU, it often turns out faster).
(Trying to use the blitter for the VDI when you have a CPU card with
its own memory is a very bad idea.)

>for the screen but can be used by software for other purposes, and NVDI use it

I've never heard of any software using the blitter for anything except
screen related (not necessarily to/from the screen) blits.
It's certainly possible, but not likely to buy you any noticeable
extra performance.

>a lot and that's why it is so fast. That's you can't use the blitter with that
>accelerator.

NVDI does _not_ (normally) use the blitter. And that's one of the
reasons it's fast (the same thing applies to fVDI). ;-)

You can use the blitter yourself without worrying about whether the
desktop thinks it's 'disabled' or not. It's not terribly pleasant to
work with when bypassing the VDI, though, and as I said, it won't do
you much good in any case.

If you want to do additive resynthesis and can't spend $20,000 on a used Technos Axcel Resynthesizer, a Fairlight III or a high-end Synclavier, check out this "Hacker's Synclavier" setup.

For a few hundred bucks it will let you do such resynthesis tricks on an Atari ST that will make all those high-ticket keyboards balk.

It turns out the drive was not spinning up. For some reason after trying
many times taking it out and re-inserting it, it finally came to life.
There were ICD drives on the cartridge, and I can also access it with AHDI.
It seems to be working great now.

Have you tried with ID 0? I've heard that the internal controller on
STacy/MEGA STs can only use that ID. Also, make sure the drive is properly
terminated. I'm not sure if the drive needs to be set to power the SCSI
bus or not, that would be something else to try. Parity is also an issue
with some controllers. Perhaps you've tried all this, but these are some
of the things that can cause problems. Good luck.

Most definately. The 1224 was designed for the 520ST series.

Any "SM" or "SC" monitor work to any Atari they had the 13 pin round
Atari video connector.

Source record: 37325

It's identical, except that the APP extension cannot be used in the autofolder. I think an APP is supposed to defenitely be a GEM program, while PRG can be anything.

>since it is a standard. Perhaps the maintainers of Calumus, Photo Tip,

Erm, Calamus and PhotoTip already use NVDI for output! Although I agree with
your general sentiments.

AFAIK it doesn't make any difference. I did notice however that many
programs that come from Germany use .APP as an extension whereas .PRG is
more popular in other parts of the Atari world.

Yes, that's because last time I replied to one of your messages I received an e-mail suggesting I not quote your whole message. Would "yadda yadda yadda" be less offensive?

B&C Computervisions has been around a long time (I've got an 810 sitting next to me with their receipt still attached...1990) and they don't slam an important part of the Atari community - auction sellers.

Ah, my ignorance is amazing! I have Calumus SL 2000, (gonna upgrade
soon) but I'm a musician, not a DTP person. All I know is that when I
print from Calumus PC version, photo's look great, but from my Falcon,
not great. I'm using an Epson Photo 700. I don't know how to use the
star screening or the FM, so my problem is no doubt ignorance! I'd
just like to be able to do similar quality work on the Falcon. Since
Cal. has a printer driver for NVDI, I thought perhaps an upgrade to
that might be persued? This might increase the apps. capable of doing
photo quality work?

>Is there an easy and convenient way to do screen captures on the ST and the get
>them over to the PC in a common format (bmp, jpeg, etc)? Oh, and I have to
>transfer between the computers via floppy disk.

Yes - Imagecopy on the Atari. This allows you to do screen grabs
with Alt+Help - even allowing you to select the part of the screen
you want - and save the image as: Degas, GIF, IFF, IMG, JFIF
(which is JPEG), PCX, PNG, PrismPaint, RSC, Targa, TIFF or Windows
Bitmap - and for may you have a choice of compression and colour
depth too. Save to floppy and transfer to PC.

It's commercial, was sold by FaST Club. Not sure if they still do
it, but some dealers may have stocks, or try second-hand.

Regards, /Peter/

> myself have risen to your bait is beyond me but here are my thoughts.

Because you are all sad TOSsers, thast why....It wasn;t bait, but the simple truth...Just accept you have a crap machine...

>
> It is true that the Amiga's graphics and sound systems where better
> that the ST's but it all depends upon the application.

Bollox, the amiga's grafix ad sound system were better full stop. Period. t does not depend upon aplication, and even if it did the AMiga had much better software....

> The Amiga made
> a great Games platform with poor ports appearing on the ST market,
> it's just a shame that the piracy levels for the Amiga was so great that
> the serious developers moved on.

Piracy sold the amiga...No one pirate on the st because being a shite machine, there was no "scene" like there as with the Amiga...

> (How much pirate software did you acquire at the time?)

Loads.

> Moving away from the Games market the ST excelled and showed it's
> true colours. The OS may not have been multi tasking but it was rock
> solid

It was rock solid because it was rubbish and unsophisticated. The simpler the OD, the more stable it is...

> Should we now move onto the Hardware itself as the Amiga was hardly
> an engineering work of art. The power supply brick was about the weight of
> an ST and had the reliability of a 10 year old Skoda.

The amiga was very well designed, much better than the ST...A sign of good design is the fact that the machine is so upgradeable...The ataris had its stupid joystick ports underneath it...what a dumb design..please/...You ST owners could not even upgrade your memory without soldering the motherboard...what a crap machine...

> The disc drive
> was a joke as replacement units where hard (and expensive) to acquire and
> the format made data interchange between platforms difficult.

The ST was an even funnier joke as the floppy drive replaceemnt wasn;t even
available...It could store 880;k on a disk and the SHITE st cuokld only
store 720k...

> The main
> board of the Amiga was much less reliable than an ST, the two
> IO controller chips used to cause no end of trouble and at times where
> impossible to get.

Hahahaha what complete bollox...you could not even upgrade your memory
without soldering the motherboard, snd you call Amiga bad...

>A lot has been made of the ST's Joystick and mouse ports
> being placed at the front of the machine but to repair them only meant
> taking
> out the keyboard and soldering up the joints, unlike the Amiga having to
> be completely stripped down and the board repaired.
>

It is a testament to your ignorance and laughable knowledge about ST's and
Amigas that you have to use repair costs as an indication of what machine
was better....YOu know the ST was shit, just accept it...

> NOW PISS OF BACK TO YOUR AMIGA GROUP.

It looks like you two are in love or something. Don't forget to put on a condom :-)

I just happend to be at a major Amiga show at http://www.amigbg.com/ yesterday with some of my Atari computers on display. They were very friendly and interested both in showing there setups and what Atari computers are capable of.

We all laughed at your posts here when I demonstrated the benefits of my Okami newsreader but the Amiga people also seemed a little embarrased to see so much foul language and general ignorance from a fellow Amiga lover...

They were actually quite reliefed when I showed them that you actually use Outlook Express to post. You really should bring down your Amiga 500 from the attic and switch over to the Thor newsreader. Much better compared to OE. But you better get a hard disk for it first... :-)

Perhaps one of disk-editor programs might be used to test reads on any
particular track, because they can access disks by sector number...

>If it's only tracking you are adjusting, couldn't you just rotate
>the stepping motor until you got maximum signal off the head?

In my opinion, such an adjustment is possible within reasonable limits with
ordinary floppies. One has to create, on a reliable other computer,
a "known good" floppy with a number of files of equal length, the length
being calculated so that the file takes one complete track on the floppy.
If they are recorded one by one on a blank floppy, they will fill the tracks
in sequence (ok, the track containing the boot sector and the fats will
have less space available) so that trying to access a particular file
will mean that one tries to access a particular track, each time moving
from track 0.

Adjustment can be done by rotating the stepping motor or by moving the
PCB which sometimes carries a sensor for zeroing head position. The
convenient way to make a precise adjustment by imperfect means would be
to move the adjusting part (i.e. motor or PCB) to one side until the drive
starts repeatedly to give errors, note this position and then move it into
another direction, through a region in which the drive will probably start
to read correctly, until again it starts to make repeated errors- and this
position should be noted, too. The correct position would probably be quite
near the middle point between the two noted positions.

This method relies on the assumption that the monitored variable changes
imperceptibly near a local extreme, but its changes are steeper at some
distance on both sides of the extreme and the change is locally nearly
symmetrical.

Off-topic: in ages past e.g. the moment of the summer solstice was determined
in this way- it was difficult to note, without precise instruments, the
extreme northward position od the rising/setting sun (the day of the solstice),
but it was quite easy to note the days when the sun rose towards some
arbitrarily set mark a couple of weeks before and after the expected solstice-
the day of the solstice was then in the middle between the two observation
dates.

Are you running MiNT to use this?

Actually, my needs are simpler perhaps. I want to access UseNet with
my TT030, 4mb ram, no TT-ram.
What is a good dialup program to try? And what would be a simple
newsreader for just small text-only
newsgroups? I used to use this machine on GEnie about 8 years ago. I
just fired it up and it works
same as always. Has a pair of 500mb hd's but no cdrom drive. Have a
Syquest drive with 230mb
removables to ferry <=> to my OS/2 box.

I d/l the latest NetBSD/Atari port (63mb.iso) yesterday, but that is
going to be a big step to make.
Do any of you also run Atari/unix on the side? How functional are the
unix ports? Not for browser-
just simple newsgroup stuff.

I'd google but I'm not sure on the search-names of Atari OSen or
Internet programs that are supported
still today. Thanx.

Message-ID: <3C82EE29.FE6DFDE5@dreamscape.com>
Source record: 37248

I'm trying to write this with Netscape on a PC, so please bear with me. I'd much rather use Newsie on my Mega STE, but for some reason it no longer works with newsgroups. When I hit the button "connect to host" the dialog box comes up, sits there for a while, then times out. No connection is made. Nothing's been changed since the last time I was successful, back in mid-January. Mail is working as it should. I wondered for a while if the ISP had changed server names or something, but Netscape seems to be functioning with the old name. I'm using Newsie 0.961. with TOS 2.06.

Any ideas?

I agree, printer drivers are lacking. And NVDI would be the most logical
choice at the moment to support.

> Just what is it you are asking for? The last time this topic

I have a new Epson printer that is capable of 2880 dpi (which truely can do
Photo-quality). Epsons (new ones) can do much more than 720.

> Further beating on the greasy stain where the dead horse used to be, one

There's where the problem is, unfortunately. I remember the days when
printer manuals came with all their codes listed (ok, they were all dot
matrix, but...).

> To make things even more complicated, there is fVDI, too.

Which can't drive printers yet as far as I've been able to tell. I'd love
for this to be supported, but one thing at a time...

> So, is what we need already somewhat available, saving and printing from
> Calamus, or is is something else?

I'd love to be able to use my 2880 dpi resolution with my Atari... But Calamus won't cut it, as I need my printer for more than just DTP, and saving and printing from Calamus is kind of a pain.

I agree that if people are willing and able to do it, we need NVDI-type drivers made (as Calamus does not make printers available system-wide as far as I know). But that's a bit pricey at the moment, from what I've heard, due to the (greed?) tight hold printer companies have on their printer codes.

> I'm now the happy owner of a CT2b Falcon.

I'm too ! That is, most of the time. Some times the system crashes whenever
I start it up in turbo mode and I can only use it in normal mode. That's when I am reminded of what a difference it makes. But on other days my CT2b
works without any problems and the Falcon can fly again ;-)
BTW, any idea anybody what could cause these sporadic troubles ?
Sometimes it also crashes when the washing machine or neon lamp or water pump is switched on or off. Neither of these causes any troubles when the Falcon is in normal mode.
And, while I'm at it, how to get rid of the CPU fan without ruining the whole CT2b so I could replace it with a more quiet one ?

As you see, for me this is the place to write about CT2b troubles, but for quite a while now nobody except me seemed to have troubles with it.

As far as I know this is correct, any program that uses specific printer drivers should set up the printer port to the required settings overriding those specified by the accessory as necessary.

>
>2) The "PRINTER.CPX" module only contains settings for dot-matrix and
>daisy-wheel printers. Obviously a bit dated for printers used today

>

This might depend on the printer, but it works on my Canon Bj10e Bubblejet printer even when the dip switch set set to BJ10 mode as opposed to Epsom emulation so it will probably work on other printers. If it works on a TOS 1.02 ST it should work under TOS 2.06 as most "improvements" to TOS were either functional or hardware specific while retaining most of the underlying core functions, commands and keyboard shortcuts from earlier versions.
You have to set it to Dot Matrix though, I dont think anything other than a Daisy Wheel print will respond to the Daisy-Wheel setting.

You probably have a dodgy PSU. The CT2 probably draws less power when
inactive, that's why it works fine in normal mode.

For me it costed nothing. But that's because I bought 3.2 some month ago when 4.0 was already there, but my dealer didn't know. I don't know what an update costs. I haven't have time to take a complete look into it yet, but 4.0 does have some useful new functions. Take a look at their website, I just don't remember the address. (www.columbus-soft.de ? Or try www.music-soft.com. That's where I got it. That guy lives 2 streets away from me in Nijmegen :-)

1906. SLIP link under MiNT

Newsgroup: comp.sys.atari.st
Date: 2002-03-04 11:30:15 UTC
From: Clement.Benrabah@wanadoo.fr
Message-ID: <a5vls7u1@wanadoo.fr>
Source record: 37258

Hello,

I'm trying to get a SLIP link between my Milan and my Falcon thank to
a null modem cable.

The both machines run under FreeMiNT 1.15.12 and have the latest Sparemint
release of inetd and portmap.

I've tried two ways:

- First, with the command slattach -l local_IP -r remote_IP -t device :
i've got the message "Cannot allocate memory" on the two machines.

- Then, with the following commands:

iflink -i sl0 -d device (device = /dev/ttyS1 on Milan, /dev/modem2 on Falcon)

ifconfig sl0 addr local_IP dstaddr remote_IP up

route add remote_IP sl0

But the ping and the other network services don't work.
ftp and telnet work well on each local machine.

During the ping, the in-errors count of ifconfig increases
slowly on the remote machine for the sl0 interface but tcpdump returns nothing.

Does anyone have an idea to solve my problem ?

Thanks.

Clement

1907. Magnum FastRAM Problem

Source record: 37260

Ive fitted a Magnum-Fast-RAM card with 8M
to a stock Falcon (4MB) and installed the
MAGNUM.PRG program in the Auto folder. The
RAM checks out OK, but if I put SETFLAGS.PRG
into the Auto folder it crashes. I think
SETFLAGS is needed to allow the Falcon to
use the RAM because it doesnt appear when
I check the RAM settings in the control
panel. Anybody used one of these cards?
All the docs are in German so Im struggling.

Cheers

PT.

Thanks for the addresses. The strange thing was that on neither of the homepages 4.0 was mentioned in any way. At www.columbussoft.de there is not even an old update information for SPP. However they have a demo of a scan program with only midi out disabled to be downloaded. Would be great for me if it would be possible to scan some pieces and let SPP convert the result to guitar tabulature.

Setflags is a tool to change the flags of programs. It's to be ran from
the desktop and not from the auto folder! :-)

I've such a card myself.

Bye,
/Pascal/

1914. WTB: Labyrinth (Activision/LucasFilm, for any computer) (I can also trade)

Newsgroup: comp.sys.atari.st
Date: 2002-03-04 17:34:12 UTC
From: Jukka Eronen <psychic@mbnet.fi>
Message-ID: <3C83B014.5878E325@mbnet.fi>
Source record: 37266

I want to buy the original 1986 game "Labyrinth"
(based on the movie of the same title).
Publishers: Activision/LucasFilm.
For any computer; Apple][, C64, etc...

Hopefully you have all the items it contained
when new, but offer even if you have one or more
items for it (box, manual, disk, ad...).

When offering, mention all the items you have,
and their condition (doesn't really matter, any
condition goes, though mint is always preferred :)

I'm also looking for The Black Cauldron by Sierra.
It has to be complete with box, manual, map, disks,
reference card, etc. And again, the system for which
you have it doesn't matter (Apple][/Atari ST/Amiga/IBM PC/etc...).

I can also trade, here's my tradelist and other wanted games:
http://koti.mbnet.fi/~psychic/fleemarket.html

Please answer to my e-mail, I do not read
this group occationally.

- Jukka Eronen

E-mail: psychic@mbnet.fi
Web: http://synchro.cjb.net

PS. I'm not sure if the "Labyrinth"-game was
released for f.ex. Atari St and ZX Spectrum.
If you know all the systems it was released,
I'd appreciate the info. My e-mail: psychic@mbnet.fi

> when the Falcon is in normal mode.

Are you using the original falcon PSU?
I had exactly the same problems before I put my machine in a tower case and
changed to a PC PSU.
It screwed up depening on environmental conditions like heat and humidity.
Or if I switched my desklamp on.

> And, while I'm at it, how to get rid of the CPU fan without ruining the

Just desolder the old one and connect a new fan, if you can find one that
fits.

Hi,

> | Can anyone tell me how to turn on the Blitter on my Falcon?

It has a 16mhz blitter in the COMBEL chip. But in higher colour modes, it is often slower than the CPU.

note that you don't have to run the whole TOS to fix a bug. you could
just intercept some vectors.

> After this I presume you put the (newly edited) TOS image file in the
> AUTO folder together with some other "loader" program which loads the
> new TOS into memory each time you boot -correct so far?

to put a new TOS in memory, this TOS needs to be relocateable.
AFAIK the old TOSes, including TOS2.05 and TOS 2.06 are not.

Laurent.

> It's certainly possible, but not likely to buy you any noticeable
> extra performance.

I have never done any programming on the Falcon, however on an STE it can be very useful. It basically copies memory about and so can be used for other things other than Video stuff, clearing big chunks of memory (for DBs, etc) and I have also used it to mix samples in real-time.

If one organises their program well, the CPU and Blit in an STE can be used at the same time, ordering is very important and I have made some nice screen routines which takes very little time (lots of dirty tricks though).

This is 68K v Blit though and even there there are some functions which can be handled quicker on the CPU than Blit, as mentioned I have never used it on the Falcon. It could be that it is there for compatibility.

I found one in the flat I bought in a cuboard, stange.... I have seen the thing to control it on Mint but I am in two minds if I want to use Mint or Magic, plus I use my printer port to hmm well print.

I have a spare ROM port adaptor (the proper one) if any one wants to swap it for a spare Genius card? Or maybe someone wants to swap a Genius for the DE-600?

Elliot...

On a 4 MB text-only unix-like stuff isn't simpler than GEM stuff.
For simple internet connections you should try STiK2 dialer, for
newsreading NEWSie will do (which is far from perfect but it works).
People say OKAMI is the best, but I never succeeded in installing and
configuring it.

Try http://www.flinny.demon.co.uk/download.html where you will find many
of the commonly used Atari internet things that don't need mintnet.

I have the driver for NVDI printers for Calamus SL 2000 and I will say
the photo quality is sometimes ok, but not what you would get on a PC.
I also have an Epson Photo 700. If using the Star Screening module will
increase the quality of a printed photo, then I am all in favor of
getting it. I was also told that NVDI needs another upgrade in order to
produce photo-quality printed images, I am not sure that will happen.

I am sure Calamus could do that if we had a compatible driver. Saving
in Calamus is fine, but I agree that the printing has much to be desired.

>I agree that if people are willing and able to do it, we need NVDI-type
>drivers made (as Calamus does not make printers available system-wide as far

>to the (greed?) tight hold printer companies have on their printer codes.

Inverse does sell a VDI-driver that allows Calamus to use all the
printer drivers included in NVDI. Works just fine.

I would first check your settings just to make sure things are correct.
However, I would think that your problem lies in your ISP. I get the
same thing sometimes. I click on "connect" and nothing happens. Try
quitting Newsie and then come back in and try it. If it is the same
after 3-4 tries, I would logon another time.

I'll try.

Essentially, the author was responding to some site that listed Wensuite
as a product whose development was abandonned. He guesses that, when he
did not reply quickly enough to the site maintainer's request about the
status of the project, it was assumed that the project is dead. Well, it
is not dead yet. However, the author goes at lenght about how making an
application suite for Atari no longer is a lucrative business and how he
got hurt by people calling Wensuite a rumour just because they never got
it to work on their system.

At least, that's what I recall of the post, seen a few days ago.

It was indeed listed to be discontinued at my site for abandoned
projects. (which btw just had an update with some more news & sources)

http://topp.atari-users.net

It seems like there have come different answers from Oxo about
Wensuite, but from what I am told just now, Wensuite is in resting
mode, since the authors have too little time to work on it.

Btw, I did never get a reply from Oxo on my request. Could of course be
due to server probs at the time. Oh well, info is corrected on my site
now anyway.

It's the Epson Stylus Color 777i. Cost me about $100 US a little over a year ago. It was brand new then (they didn't even have replacement ink available at office supply stores for a few months after I got it), so I'd think it would have gone down in price a little by now (OfficeMax in the US was giving them away free with a $500 digital camera purchase last May). It has both USB and standard parallel ports, and so I can have it connected to both my iMac and my Falcon at the same time! Quite nice. As an example of quality, I scanned a photo I had taken with my 35mm camera into my iMac (the Epson scanner reads 2400dpi), and printed it on glossy photo paper. Once cut to the same size as the original I literally couldn't tell the difference between the two, even extremely close up. It's unfortunately an ink hog, and so I am constantly replacing expensive ink cartridges.

If I could get drivers for this printer on my Falcon and do the same, that'd be incredibly cool!

Hem... one of the reasons could be that the neutral and live wires
are inverted in the wall outlet, so interference can reach the mb.
This sometimes happens with Hi-Fi - cracks in the speakers when you
turn on the light.
When your bird is in turbo mode, it becomes more sensitive to
interference.

I would suggest that a Dat player is still an indispensable item in a
real studio,firstly the A/D-D/A converters in most decent Dats are
miles ahead of any comparable converters in computer based cards or
the Atari/Soundpool peripherals
I think having both with the dirt cheap price of CD burners is quite
feasable and de-riguer for practical purposes..also the metering and
gain control on the Dat machines is better than most cd burners...

Yeah, but I think the real slowdown is that crazy hit counter. The new
graphics are fairly small.

Look for even more tweaks in the coming weeks! (Hey, that rhymes!)

> Or if I switched my desklamp on.

I think I replaced the PSU when I put my machine into a tower too. But
the
effects sound so amazingly similar. So maybe the replacement PSU has
some
sort of defect or the 20GB IDE harddisk I put in last summer needs much
more power than the 1GB SCSI harddisk I replaced by it. Could well be
that
the problems started then.
Are there any special things to be considered or could I buy any PC PSU
to try whether that helps ?

Thanks to all who replied. I wouldn't have thought of the PSU myself.

I have a Weitech adapter for a MegaST which
came with an ET4000TC card and NVDI 2.5. Ive
never managed to get anything out of this,
although it did work fine I was told. I also
have 2 spare ET4000 cards (one boots fine
in a PC the other doesnt?).

Im not sure if this is an early CrazyDots
adapter or a Nova. Does anyone know? The adapter
does have a space for a FPU by the looks of it.

Hi, from all I have read, the blitter is definately built into combel. The 68030 can blit faster than the blitter than tho, so using it is pretty next to useless. On a CT2 it has to be switched off as it will not overclock.

Mark

Thanks for your response! Have you ever heard the AD converters of the
Line Audio stuff? (The FAD-8 is a Line Audio peripheral from Sweden, 2
in, 8 out, unbalanced, 18 bit.) Sounds great, IMHO! :-)

> ï¿½I think having both with the dirt cheap price of CD burners is quite

Yeah, both would be excellent! But a DAT (studio standard) is probably
what to get first.

To go directly from a DAT to F030, you need an FDI, which will let you
transfer recordings to the HD of the F030 with no A/D conversion, and
no change in the signal. Am I correct?

Source record: 37154

Hi all,

I need some help programming a Falcon, I have done much on the STE (68K, Basic, C) but most of it was hacking (not cracking, demos, etc). I need to write clean apps which will run in Mint, Magic TOS, etc and make nice little GEM Windows. I want to put my talent (lol) towards making some usable applications for everyone.

My main problem is making such things as TSRs, GEM interfaces and DSP code, I have lots of tools but I really need simple examples that I can expand from.

Any links for code would be really helpful, and anyone wishing to directly help me with parts can earn themselves a beer ;-)

Elliot...

Hi,

> to useless. On a CT2 it has to be switched off as it will not overclock.

This is only the case for some Falcons.
The big problem is that the blitter can only access ST-RAM, and the routines
in TOS does not compensate for this. Therefore, it needs a "new" VDI like
NVDI or fVDI.

Regards

/Peter

I'll put some words in Roberts mouth:)
He means the diagnostic cartridge for the Falcon. It will allow you
(most of the time) to boot a dead Falcon from the cartridge port and
perform diagnostic functions on the machine. There about $50.00 US.
I would loan mine to someone reliable and local (within the US).
Mike

Hi TJ,
Newsie 0.961 is my regular usenet and email app. Usually with no problems.

On 3 Mar 2002 22:46:50 -, "Thomas J. Andrews" wrote:
>I'm trying to write this with Netscape on a PC, so please bear with me.
>I'd much rather use Newsie on my Mega STE, but for some reason it no

I suggest changing parameters to <Server Address:Connect at Startup>,
then SAVE PREFERENCES and Quit. After restarting you should see the list
of new NG posts straight away.

Charles.

Hi Elliot

Why don't you try getting in touch with 'The Reservoir Gods'. Top Atari coding team, and personal friends of mine.

Go to http://rg.atari.org and send them an e-mail.

There are also lots of Mr Pinks' code libraries that you can download in the source section. He is a very helpful guy, and I am sure he would be interested in getting more people coding on the Falcon.

Also don't forget to try out Chu Chu while you are there.

Kind Regards

Graham

Yeah, I think Smurf may also, but none of them do near the kind of job with my epson photo 700 that can be done with my pc laptop. When I print with Calumus 2000 on my PC, it looks great, but not from Calumus 2000 on my Falcon printing through NVDI. That leads me to believe the printer drivers need to be updated.

This works quite nicely if your printer understands the Epson FX
protocols. Most 9 pin dot matrix printers in the 1980s did.

Nowadays, there are AUTO programs that you could load to duplicate
this, but why bother?

Message-ID: <ce22d101.0203052105.312dd95@posting.google.com>
Source record: 37181

Hi All

BIG NEWS!!!

ACE MIDI, the Atari Falcon Softsynth has just been released!
Thats right! Finally! Thomas has put in 2 1/2 years into this , and it shows it! This brings Atari up to a new level! (and in 2002!)

ALSO: DR Ambient (Guido Goebertus) has just released a Falcon 256 color version of his AEX Intelligent analog sequencer. He has also updated his ST and TT Hi versions. More stuff!!

Go here for both articles at the new issue of My Atari :

http://www.myatari.net/latest.htm

Click on "ACE: World Exclusive" and
"I Want My AEX"

It sure pays to beta test, cause I get to write the articles! Had two this month to write. Please check them out!

Right now, the ACE demo is on the New Beat site. Link at the bottom of the article. They might incorporate the ZIP into the article during the month, along with a set of my own sounds I created in ACE.

There is also another ACE demo tune I did at the New Beat site. Its small (950K) compared to the 5 or 6 M download of the first one. I did this demo with Notator, run on an STe going into the Falcon and running ACE.

Have fun with ACE and AEX.

Thanks Thomas and Guido for continuing to program for Atari !!

Tim

Netscape 4.77 is really still my main browser, so, of course I make it work with it! (Lately though, Netscape 6.2 has just about taken over, but it doesn't seem to handle the tables right.)

The site isn't that complicated, really. The only really cool thing that Frontpage does that I like (other than it's incredible ease of use) is the page includes. That's how I get the same left-column on all of the pages.

BTW, been slaving on yet another new design. It looks as it does now, but with a few button changes and making all the pages with the same theme.

The new Epson printers are cpu intensive. With a Celeron@300mhz
everything
else drags to a halt while the color printing is going on . . . and
on. 8x11 page
takes upwards of 8 minutes for a single full-color jpeg. Overclocking
to 450mhz
helps a bit. No way my Falcon or TT is *ever* going to color print on
these color
printers, drivers or not.

It took me months to get my copy of spp4.0. The guy who runs it is nice,
but his office is an unbelievable mess. (I visited him). He makes a lot of
promises, but tends to forget them within a day or so. Try to mail him
once every week :-)
Or send me an e-mail with your wishes and I'll print it out and give it to
him personally. The guy lives 2 streets away from me.
My e-mail address is m.tarenskeen-NOSPAM-@zonnet.nl (without -NOSPAM-)

Have you tried replacing the name of the newsserver in the configuration
with its IP number ? I remember having had similar problems. I replaced my
newsserver (news.zonnet.nl) with it's number (62.58.50.21). You can find
out the right number with tools from the STiNG dialer, or with nslookup
or ping if you have a MiNTnet system.

Something else to try, if you use STiNG: remove the cache.dns file, and
restart.

Netscape 6.2 (Why donï¿½t you use Mozilla 0.9.8 instead, itï¿½s the same,
but newer engine, except some AOL stuff that you probably wonï¿½t miss
anyway) is a brilliant browswer supporting W3C-standards, so when it
doesnï¿½t seem to handle tables right, itï¿½s because Netscape 4.7x is so
non-standard and buggy, not because the Mozilla engine makes the
mistakes.

I think we were talking about the same thing I just failed to express it
correctly, perhaps if I had said "As far as I know this is correct,
however". What I was trying to say was that your are correct with respect to
printing from the desktop (TOS) while also pointing out that the control
panel settings do not necessarily relate to those used by other programs.

>> >2) The "PRINTER.CPX" module only contains settings for dot-matrix and

I don't know, I believe that TOS prints using a generic ASCII only system
and so if the differences between the various bubble and inkjet systems are
small I might be ok, perhaps someone at comp.sys.atari.st.tech will be able
to answer this better than I.
However from problems I have encountered at work I suspect that in near
future (if not now) this may not be the case. Unfortunatley, unlike older
printers such as the BJ-10 that had some of its perameters settable on the
hardware using DIP switches all printers produced these days appear to rely
purely on the printer driver software and so without the software I doubt
that printing from TOS will be viable.

Another thing that all Atari owners should consider is that as printers are only designed for the PC these days there is a growing trend for PC's to connect via USB ports and so unless someone can create a Atari to USB interface cable we won't be able to connect to a printer let alone print from them.

< cut >

>> You have to set it to Dot Matrix though, I dont think anything other than a

>
>So you're saying that by setting it to "dot matrix" there's a
>possibility that it might work with just about any printer, while
>"daisy" only works with those really old type daisy-wheel printers?

I beleive so, it really depends on how much of a difference there is between the modern printers, as until the mid ninties most printers contained an Epsom emulation mode to ensure a psudeo compatability between all printer hardware and software as 99% of all software used to be supplied with a basic Epson driver if nothing else. Thererfore if the Daisy -Wheel setting will not work in Epsom mode it probably wont work on any modern printer. Dot Matirix on the other hand is also refered to as graphics mode, if you think about it this is what all modern printers are as they opperate on graphical Dots Per Inch system and so I should have a good chance of working, excluding any of the probelms I metioned above.

So doing this kind of printing (like 1440 by 720 on an epson) is a matter of horsepower to do quickly? My 475 P2 laptop dosn't suffer much, and my 700ish P3 desktop at work has no problem. I suppose there are many factors that might affect this. Perhaps printing at this quality is possible on my CT2B Falcon, but would take forever, like making MP3's? Perhaps my CT060 (when it gets here) will have closer to the kind of CPU speed to handle it well. If so, I sure hope that those of us who have bought one, and possibly Hades and Milan 040 and 060 users might support another upgrade to NVDI, or anyone willing to take a shot at it? I would!

Hello ppl,

I was browsing your ng, and visited some sites I found on Ataris. It seems that they got a long way since I last saw one (some years ago). I was at a point to choose an Atari or an Amiga, and the second's charms won me. I'm still using my Amigas (500, 1200, 3000).

I just wanted to know how far Ataris have gone. I've seen something like PCI cards, new OSes, etc. Anyone available to enlighten me more on this?

Thanks,
MrZammler

PS
I'm sorry to see so called "Amiga users" posting such messages here. Please just disregard them.

Hi!
Well, after Atari went south, a few 3rd-party companies took over the design and distribution of "TOS" computers. C-Lab took Atari's left-over Falcon stock and upgraded them a little and recased them. Medusa Systems made the Medusa and Hades machines (68040 and 68060 CPU's, PCI, other more up-to-date technologies - see http://www.kingx.com/kingx/medusa/), a company called Milan made a 68040 machine (see http://www.milan-computer.de/), and now I *think* they're the ones behind the xTOS computer (see http://www.xtos.de/) which will use the newest "Coldfire" CPU's from Motorola.

Companies and people came out with various upgrades for Atari's (particularly the Falcon), such as CenTurbo 1 (overclocker for the 68030 CPU) and 2 (replaced the 68030 CPU with a faster one, added full 32-bit bus, and SD-RAM slots), Nemesis (another overclocker), Afterburner (68040 CPU and faster memory), Eclipse (PCI adapter, mostly used for graphics cards - see http://fmax.atari.org/), Galaxy card (for the TT - graphics card and in future versions, an ethernet card - see http://gem.win.co.nz/mario/), Nova (ISA slot adapter for graphics cards), and things being developed are the CT60 (68060 CPU with SD-RAM slots - see http://www.czuba-tech.com/), and Tempest (PowerPC 603e CPU with SD-RAM slots - possibly a stopped project :(- see http://fmax.atari.org/).

OS's include AES 4.1, Geneva 1.06, Magic 6.2, NAES 2.0, and XaAES (I'm sure there's more, but these are the main ones). Lots (for a "non-mainstream platform") of new software coming out all the time, too.

Some of the many info and software sites include: http://www.atari.org/, http://www.atariuptodate.de/, http://www.magical-sides.de/, and http://users.pandora.be/tos4ever/utsi.htm.

If you have any other questions or comments, feel free to ask!

> PS
> I'm sorry to see so called "Amiga users" posting such messages here. Please
> just disregard them.

Yep, already done. I have a feeling none of them are real Amiga users,
as one of particular note went into an Amiga newsgroup and cause similar
problems. I know that most people who truely love their machines have more
respect than that for people who use computers with similar histories and
current status. I think Amigas are cool, as are Atari's. I just happen to
have more use for the Atari's features!

Good luck in your info search! Hope this helped!

The old Netscape is actually up to 4.79, check it out.
ftp://ftp.netscape.com/pub/communicator/english/4.79

Also, if you're liking NS6.2, I suggest trrying Mozilla (mozilla.org).
It's the codebase for NS6.2, except the newer Mozilla builds are beyond
the NS6.2 build. I find Mozilla 0.9.8 better than NS6.2 all around. Plus
it has features like gestures and tabs that aren't in NS6.x yet.

It just means, for the ordinary people like me, that you should use a
patch like HSModem or similar. There are a few but HSModem is the best
one imho.

> There's an AUTO program and a CPX module.

Not sure you're speaking about the HSModem package here.

> Should this CPX module be used *instead* of MODEM.CPX or in addition to
> it? I would guess the latter as it doesn't have the same settings, but
> only a "lock/unlock" switch for RTC/CTS (whatever that's good for).

Hmmm... Maybe I didn't read your first message well. The original
modem.cpx by Atari is _not_ buggy afaik, "just" TOS serial routines are.

I used to use this one along with the HSModem package, years ago, before
the availability of STinG and the serial.cpx coming with it. It was just
not very comfortable to use it with speeds above 19200 bps as I had to
set 134 for a real 57600 bps with my Falcon (see HSModem docs for the
details, I think there is an English version by DDP). This is why the
replacement coming with STinG is usefull: you setup directly the speed
you want to use. It _replaces_ modem.cpx, do *not* use both at the same
time!

If your ST is not modified, I think you can still use the original one
safely.

Bye,
/Pascal/

I know someone who has an extensive library of ST software still sealed. I saw an assembler package it was pretty big. I didn't get any of it because I'm more interested in Atari 8-bit development and picked up lightspeed C sealed for 8-bit.

Let me know what you need, I will make a list and take it with me. I am going back on Saturday so let me know and I'll see what he has available.

Roughly speaking, Atari and Amiga are about at the same level of
technology. A 68060 card, multi-tasking OSs, modern desktops, very
limited PCI support, Debian Linux, and somewhat successful attempts to
port the OS to motherboards designed for Windows exist for both. The
Achilles heel of the Atari is in web browsing -- CAB is really
starting to show its age, and nothing yet is available to replace it.
I love my Falcon, but I just bought a Linux box to use almost solely
for web browsing.

Printing isn't rocket science, and the primary limitation is knowing
the control codes for the printer (they are no longer free). One
possible snag is the difference between page and line formatting -- if
an entire page has to be created (such as on a laser printer), the
Falcon could run out of memory. On the other hand, if you are
creating one line at a time, it's just an issue of speed. One such
example is to play with the dithering techniques of Imagecopy. The
best dithering is so processor intensive that a single 4"x6" print
takes over an hour, but it does it.

Galen

2004. PowerUp2 Falcon

Newsgroup: comp.sys.atari.st
Date: 2002-03-06 20:10:38 UTC
From: Neil Chester <neil@adel6.freeserve.co.uk>
Message-ID: <1015611364-22934AEicMi@adel6.freeserve.co.uk>
Source record: 37131

Since two months ago I have acquired a PowerUp2
Falcon, which it seems was once owned by programmer
Simon Coward. A number of programs on the computer
control whether the Powerup2 is On or Off but I don't
know whether this affects the performance of the
machine or not!? Are there any downsides that people
can report?

Also there is a small program in the AUTO folder of
this machine, called MAGTOROM.PRG by Uwe Seimet, what
does this do?
Can I boot up in Magic 6.20 without this? And can I
use an altered MAGIC.RAM file from a CT2B system?

Hope someone can shed some light on this old machine!

Neil :-)
3 Atari Systems:
Falcon 030 PowerUp2 32MHz/14/1Gig/CD
Falcon 030 MkX CT2B 50MHz/78Mb/20Gig/CDRW
Atari Calculator (!)

Hi Barrie,
Will v3 run on the Falcon? If so, can I upgrade from 2.06 without
needing a different key or DSP plug? Again, if so, the cost? You can
either post your response here or E-mail the info to my above address.
Thanks,
John G.

> Falcon could run out of memory.

Yeah, standard Falcons might, but many folks (like me) have extended
ram. I guess I'm thinking that folks who are hanging with Atari are
getting bigger machines and would be interested in extending it's
abilities. I'm getting a CT060.

>On the other hand, if you are

OK, it is possible, but it takes codes (not free) and time (waiting
for it to print.) If many people are like me, being able to do it at
all, if slowly, is better than not at all.

There's gotta be a way!

Plus, there's quite a bit more data to throw around the screen.
When I'm scrolling through text in Newsie or Everest I'd even go so
far as to say an unexpanded 520ST is faster.

That said, MPG's in Aniplay or even 1stGuide are quite a bit faster

Sorry for taking so long on this one, Hallvard, but I knew I had some
info on this subject (though I'm not entirely sure whether some of
these may be TOS 3.06 rather than 2.06 specific).

* Newdesk.inf files can be loaded after boot-up
* Applications can be assigned to function keys
* Printers can be given desktop icons
* more than one file can be dragged to an icon, either to file copy or
to print
* Display masks can be set for directory windows
* If a group of files are selected for a desktop operation (ie copy)
if you run out of disk space then the uncopied files remain
selected.
* Scrolling a window will not de-select a files that have been
selected.
* Window can be scrolled with the cursor keys
* Desktop windows increased from 4 to 7
* Window elements can be edited for colour or pattern (is this an
XControl feature rather than TOS?)
* Size to Fit option for directory windows
* User-designed desktop icons can be loaded using DESKICON.RSC
* Desktop icons can be reassigned using Install Disk Drive
* "Unsorted" file view option available
* System memory shown in Desktop Configuration menu option
* Preserve or update timestamps during file copies
* GTP option added
* Parameters can be passed to GEM programs
* keyboard shortcuts available to all desktop menu entries

> list below?

Some from Mark Baines' A-Z are:

* RTS/CTS flow control bugs (largely) fixed
* Parity and word size SCC bugs fixed (from earlier versions of TOS 2.0x)
* IOREC fixed (from earlier TOS 2.0x)
* VDI BitBLT improved
* floppy spin-up delay reduced
* media change detection improved
* floppy disks with only one FAT supported
* greater compatibility of programs using Timer-A
* multiple AES events when scrolling are reduced

Some of these relate to TOS 3.06, but I think they related to the TOS
2.05/2.06 upgrade too.

I don't think it bypasses TOS. I think if the TOS setup doesn't
provide the right info, it will look at the environment variable and
get the info needed from the directories specified there.

I don't know if priority is given to one rather than the other.
I think it's like the following Env var:

#_ENV PATH=C:\;D:\PUBLISH\GEMSYS\;E:\MBROWSE\

In this case, if the first path isn't right, it goes onto the next in
turn.

And it was ex-Atari people who designed the Amiga. It was going to be Atari's next machine except chicken-lips bought the company. Ex-commies built the ST. So as a fanatical Atarian, I'll take the Amiga. It is the second generation Atari.

Seeing as how the Amiga has a custom chip set to handle the sound and
graphics, the ST isn't going to outperform any Amiga. No other CPU is usable
on my MegaST2. Atari totally screwed up the hardware. You can't even add a
co-processor without patching TOS to death. You can stick a 68010 in an Amiga
and make up for the slight Mhz difference. Ever stick a 68010 in an ST?

The Amiga 1000 had a 68020 expansion for it. The STs never did. So the STs
never had "the same CPU" to outperform anything.

NFW! I tried the Jit Mac emu on my P4. Looked cool at first, but all
my good FPU stuff bombs pretty quick. Missing my AB/Rack. It's spread
out on a table waiting for the 060. Hocked my CLAB case, so the Mighty
Sonic bird is in the closet. Think there are two more around
somewhere. But,,, the P4 and new windows..doesn't support my ES1200C
scanner. I have GTLOOK, can I run a TOS emu and use the scanner?
Wouldn't mind using Photoline either. Think Bill will mind?

> 3Meg!?, how times have changed, a 3Meg download is the norm these days for

In article <N9Mf8.66$w82.101935@newsfeed.slurp.net>, ebaiz@skyenet.net says...

>
>That would be my question also. The Amiga was better in graphic
>cabability and sound. With the coming of the STe, that closed the gap
>significantly.

I had the graphics upgrade done to my MegaST2 (JRI, I forget what its called) to match what was in the STe and it did nothing to improve the graphics. Hires was still mono, medres was still 4 colors, and lowres was still 16 colors. Increasing the palette only make it sound better.

>The ST always has and still is superior in ease of use,
>MIDI and stability. The ST monitors are better also. Both computers are
>great and both have their high and low points. Now the subject should
>be dropped.

The ST was easy to use because there wasn't much to be done with it. I've had an ST for 15 years. A 1 meg 520, and two MegaST2s. The MIDI ports are still virgin. The only thing I saw of any use for the MIDI ports was to make a simple network game environment. (MIDI Maze ring a bell?). Stability isn't a word I would use in conjunction with the ST. But neither would I with the Amiga. At least in the TOS 1/WB 1 era.

The monitors were great. If you like proprietary equipment. I thought it was one of the most stupid things Smilin' Jack ever did. That is unless you count all the lies he made.

The thing that made me drop the ST was the difficulty in booting in one res and trying to run a program in another. (and you say, "ease of use"!?). The Amiga could display every resolution it was capable of, at the same time. If you change resolutions with GEM, you lose it. EASE OF USE!?

I'm not sure, but what I can do is borrow a newish (came out about two years
ago) HP Desket and Cannon Bubble Jet printer from work and test them, I'll
let you know which, if any work sometime next week.

I dont own a TT so I cant be sure, but that looks like an FPU(co-pro) socket. If you want to know exactly whats inside the box download the squeematic, it will tell you whats where.

BTW, I guess you know that a missing FPU wont stop it from booting up.

2026. Programming in C: calling fsel_exinput()

Newsgroup: comp.sys.atari.st
Date: 2002-03-07 10:52:22 UTC
From: matthias.arndt@tu-clausthal.de
Message-ID: <slrna8ehij.17m.matthias.arndt@jll.heim7.tu-clausthal.de>
Source record: 37229

Hello ST programmers out there,

I'm currently trying to call fsel_exinput() from a Pure C program.
(STonX running TOS2.06)
I was able to register a GEM application via appl_init(), form_alert() does
work as well and the code terminated correct using appl_exit().
But I'm now stuck with the file selector. I've only some rudimentary
documentation. How must I call it to recieve a pointer pointing at the
selected file?

Another regarding fsel_exinput() - how do TOSes below 1.4 react on this call?
Bomb them out or do them simply call fsel_input()?

Does somewhere exist a GEM sample app that is NOT written in old K&R C and
that is somewhat small but shows the most interesting things?

thanks for any advice and code fragments,
Matthias

Both I think.

> As for that "SERIAL.CPX" that came with STinG: was that also for
> modified STs going above 19200 baud, or does it fix something that even
> users of 14400 baud modems will notice?

I don't think that the CPX fixes anything. This is the job of the
patch(es). The CPX is "just" intended to make it easier to use the new
speeds when available, for programs that do not set the speed
themselves, and to setup a few more things.

> I used "Connect" back then (a terminal emulator) and in the modem
> settings I was all of a sudden able to choose speeds above 19200 baud,
> which of course was thanks to "HSmodem".

The same applies to StarCall or Semper for example.

> But.... if people don't have a modified modem port and because of this
> can't go above 19200 baud -do they need to add any of the modem/serial
> patches and/or additional CPX modules?

The patch(es) are still needed if one want to use any flow control.
Maybe it's not need to use flow control with rather low speeds (under
14400 bps) but I'm quite sure it's requiered from 28800 and above.

In the ol' days, I used to connect my STf to a Minitel (a French Videotex terminal used to acces to some usefull services). Because of the very low speed (1200/75 bps asymmetrical) just 3 lines were requiered: rx tx and gnd. No rts/cts -> no patch needed.

Bye,
/Pascal/

If you have an ST, TT, or Falcon you're in luck. I have just started a room in Filetopia which has hundreds of commercial software releases for the Atari series of computers. All you have to do it goto http://www.filetopia.com/ and download the filetopia client for your PC. Once you have that set up join me in channel #atari If you know how to use IRC you shouldn't have any problems figuring out Filetopia. We have many many programs all on a T1 server.

Have a good day!!

Hi John. Version 3 might run on your Falcon (I dunno) but 2.06 is the more advanced version, despite the version numbers. Cuebase v3 is the last version for non-falcon ataris, 2.06 the last version of Cuebase Audio Falcon. Cuebase v3 has no audio capabilities, and is just for MIDI. Cuebase Audio Falcon has all the MIDI & Scoreing capabilities of Cuebase v3.

Where can I find the schematic? I know that the TT030 MB came in two
flavors. The one I own is different from the one in the picture. The
missing chip is labeled U101.

Thanks,
Chris

> >The ST always has and still is superior in ease of use,

No it isn't...You telling me TOS is superior to Workbench? What
exactly do you mean by ease of use? The "ease" with which you put the
joysticks underneath ST, which leads to numerous damaged joyports? The
"ease" with which TOS couldn't multitask and you had to do everything
one at a time?

> >MIDI and stability. The ST monitors are better also. Both computers are
> >great and both have their high and low points. Now the subject should
> >be dropped.

ST monitors may have been better than the old Commodore ones, but the
AMiga could be plugged into far better monitors, and anyway we aren't
even talking about monitors (leaving aside the second question: "whats
the point of having better monitors when the grafix on the ST were
shite"??)

>
> The ST was easy to use because there wasn't much to be done with it.

Ah yes...Sorry, I withdraw my sarky comments above....The ST is a
basic games machine, and a toy, much like a handheld video game...

> I've had
> an ST for 15 years. A 1 meg 520, and two MegaST2s. The MIDI ports are still
> virgin. The only thing I saw of any use for the MIDI ports was to make a

Exactly, good point NJ....

> Atari totally screwed up the hardware.

Yes, in a major way...

> You can't even add a
> co-processor without patching TOS to death.

As I have said many a time, EASE OF UPGRADEABILITY is one of the many
signs of good design. A well designed comp like the Amiga can be
upgraded again and again, and easily...Not so the ST, which is just a
games console with a keyboard...

> You can stick a 68010 in an Amiga
> and make up for the slight Mhz difference. Ever stick a 68010 in an ST?

And anway, because of the superior desogn of the Amiga with its custom
chips, the MHZ difference dod not mean a thing...It was in fact fastre
than the ST anyway because it had higher MIPS...

>
> The Amiga 1000 had a 68020 expansion for it. The STs never did. So the STs
> never had "the same CPU" to outperform anything.

Well said, well said....Lonny, just hide your face....

Yes, lets ignore the fact that I explained I had made a typing mistake
in the post after the one above...I rewrote the statemet and admitted
the error. Being a typical ST owner, you only pick half the facts and
use that to make your point. A bit like your argument against the
Amiga. You keep bringing up half-truths and untru facts....

Yes I said the line above, but I made a mustake and corrected it
later...YOu being a chump, can't get into this debate with anything
original (being a 2 barincell ST owner) and so try to get your foot in
by cutting and pasting old typo's....

Pathetic.

Hi there!

I'm sick of seeing these useless posts from these dorks. I don't want to have to sort out what's good discussion and what's useless trolling. How do you set up a kill file, both on Atari programs and Outlook for Mac? I've never done it before. Does it only work with certain names, or can you kill a whole thread? Thanks!

I hope these guys and others like them get a brain cell and go away, once realizing they're doing nothing but annoying people and disrupting useful conversation. Darkling at one point said something to the effect of, if you don't read or reply to it, it shouldn't disrupt anything. But just today I had to search through a long list of "NewDarkling" posts to find something worth reading. I hate that. It's incredibly disruptive, especially knowing that nothing intelligent or worth anyone's time is being said by this guy.

Just a note... I strongly suggest people just stop replying to these idiots (if they are indeed more than one person). Maybe then they'll get the message. I've stopped reading these posts altogether, but obviously not everyone has. I think doing that is the only way they'll go away. They'll get bored because no one is falling for this crap, and go bother the PC newsgroup or something. I long for the day when I can open up this newsgroup and see nothing but people helping each other and having peaceful, honest discussion, like it used to be.

The HP can take a raw ASCII dump, which will give you basic text
printing. A printer driver will be needed for anything else (i.e.:
NVDI or GDOS). One interesting possible exception might be the
Brother 14X0 series of laser printers. They have built in Proprinter
emulation, and probably (mind you, I haven't tested it) will take the
FX command set OK. If they don't, these laser printer also have PCL5
emulation, so you could just use it as a very big Deskjet or Laserjet
if the experiment fails.

northstar2010@_I-hate-spam_yahoo.no said:

>I know about the "HSmodem", but was under the impression that it was to
>be used with STs that had their serial interface modified for allowing
>higher speeds than the standard 19200 baud.
>("HSmodem" in conjunction with hardware such as "RSVE", "ST-ESSC" or
>similar).

Hi Hallvard!

No - HSMODEM can be used without any hardwarwe modifications too. It
rectifies some errors in the ST's handling of the serial port (I think
it's something to do with the size of the receive and transmit
buffers, and also the RTS/CTS signals - which means request to send
and clear to send, a kind of start and stop signalling protocol) and
it also maps some higher speeds to the reported very low ones (150,
300..) so you can run at a range of higher speeds.

It offers a number of small AUTO program drivers for various ports and
configurations. From the HSMODEM7 docs:

~~~~~~~~~~~~~~~~~~~~~~
Select the driver you need. The following hints should help you:

Basic Equipment:
For ST, STE, MegaST: MFP.PRG
for MegaSTE: MFP.PRG, SCC.PRG
for TT: MFP.PRG, SCC.PRG, MFP_TT.PRG
for Falcon: SCC.PRG

Additions & Enhancements:
If you have replaced the original 85C30 in your MegaSTE, TT or Falcon with
a 85C230A or a Z85230, you can use ESCC.PRG instead of the SCC.PRG. The
"computer in its original state" contains only a SCC, so only use the
SCC.PRG in that case!

If your Falcon has been modified to use the (normally unused) MFP serial
interface (MODEM1), use MFP_FALC.PRG as well.
If you have installed the ST-ESCC hardware modification in your computer,
use ES_ESCC.PRG in addition. Those who have made other interface
modifications should read the documentation and can also ask me for
advice.

With an (unmodified) PCLK of 8MHZ the following Rsconf-Baud rates
are possible:
~~~~~~~~~~~~~~~~~~~~~~

(new - old)

SERIAL2:

230400 - 200
115200 - 150
57600 - 134
38400 - 110

MODEM2:

38400 - 110
153600 - 75
76800 - 50

Additional speeds on MODEM2 when using a MegaSTE or Falcon (TT after
modification):

230400 - 200
115200 - 150
57600 - 134

~~~~~~~~~~~~~~~~~~~~~~~~
I suggest you read through the docs that Mick Lock translated and
I corrected. They (should) come with the HSMODEM package, but if
not I can email them to you easily.

Regards, /Peter/

>printed anything at all. Can anyone comment positively on this?

AFAIK, this desktop function was intended for Epson FX-style 9-pin printers only. There are two things to be considered: The commands sent to the printer to put it into a graphic print mode and control this for horizontal and vertical feed, and also the dot resolution. The Epson FXs had 180x180 dpi, some 24-pins 360x360 maximum, while most inkjets and lasers have 300x300 upwards.

So even if the Atari routines worked with 24-pin and inkjets etc in Epson emuation mode (i.e. supporting the ESC/P command language), the resolution would be wrong. But most modern inkjets and lasers support a variant of HP's command set, (Canon has its own) which are completely different. That is why Imagecopy and JM-Snap etc were invented.

>> -Pressing the ">" key (print the active window's contents)
>>Is my assumption correct?
>
>Nor this.

Presumably this applies here too if you are trying to print graphics mode. But if printing text only in ASCII mode it ought to work, I believe. After all, in that case you are only sending the hex values of the characters to the printer.

Regards, /Peter/

Actually you can view me and my Atari TT in action at:
http://www.weemeet.net/wwwamigbgcom/live/webb1/pages/P3020016.htm on
there official website. Note the text "Amigarulez" that might cheer you
up a little...

If you go to http://www.amigbg.com/ and click on the "live.amigbg.com"
link in the middle you will find lots of Amigas that will make you drool.
But beware, there are some Ataris there as well, so keep a plastic bag
just in case you have to throw up :-)

And off course, it _could_ all be a fake... Only those who actually were
there would know for shure...

In the Okami/Newswatch combo you simply add a text file named KILL to the
\OKAMI\SPOOL\NEWS\ folder with the content:

From: *sinclap@*

to stop his posts. This is if you sticked to the old NOS.TTP folder
arrangement.

> Just a note... I strongly suggest people just stop replying to these

Well the problem is IMHO more those who get offended by there posts and
reply with irrelevant stuff themselves.

If you stay on topic (at least partly as I am doing now) and _only_
follow up if you have something relevant/constructive/humoristic to add,
all will be fine regardless of what others write. Simple as that!

Do not forget the good(?) old Atari SMM804 9pin matrix printer that is
directly supported by the PRINTER.CPX and will give a perfect ST High
printout. Yes, I have one of those here.

You are cool too! ;o)

Actually as I said before early on during this sillyness concerning the amiga, it has it's place, but not on my desk. As for filters, it works wonders if you want to master the one sided conversation, certain people, about 7 now can just read my posts and live with it. Or they can turn on their filters and do the same to me. LOL

In outlook you just select 'rules' in the menu, then select usenet, then add a rule, set the criteria you wish to filter. Example if you wish to kill all jubect lines with 'amiga' enter that as the search criteria. You can search subjects, names, address, whatever. It's not hard to do.

Hi All

Looks like this is a good month for Atari-MIDI releases, as I have been beta-testing with a certain David Leaver in working with the original source code of DX Android (by Tom Bajoras) He was finally able to take out the copy protection, so now we have a working edition of this fabulous program.

Go here:

http://groups.yahoo.com/group/atari-midi-archives/files/SOUNDS/Yamaha/Dx7/dxdroid.zip

(copy/paste whole thing to your browser address field)

Its only about 50K. You will need a blank disc ready when you start the program to put your sounds onto.Read the TXT file as we have put together a tutorial (from what I was able to figure out without a manual! :-)Works in ST Med or St HI res.

Here is a brief description from the TXT file:
==========
DX ANDROID by Tom Bajoras. Assembled by David Leaver from a modified version of the original source code. Released as freeware.

A little history:

The program was originally named DX-Droid, but had to change its name to appease the dark side of the force..err... George Lucus and friends, so the final version was DX-Android. There were even ads in the electronic music magazines at the time with a picture of a droid (very akin to Star Wars) playing a DX7 and ST computer along with a TX816 rack!

Those with DX7's and other 6 Op synths today can still use this excellent program. For analysis of FM, its many screens and layout should please the more intellectually minded as well as lay musicians who still use FM. DX-Android was one of the first programs to incorporate Random Patch generation, thus making it a landmark application in its time.
==========

It works in steem as well! (Steem is an Atari emulator that runs on a PC. See : http://tamw.atari-users.net.steem.htm)Before running the program in steem, put a virtual blank disc in the virtual A drive (by using the disc manager)

Tom Bajoras also gave me about 8 discs of sounds. I have to figure out how to create disc images..so time will tell. I will also be adding it to the Hybrid Arts page on TAMW. Still have to make screen shots. Will keep you informed.

Have fun with DX Android! Anyone ever work with this program?

AFAICR, using fsel_exinput() on a pre-1.4 AES will pop up an alert
with "Bad AES call". However, some compiler libraries may detect the
older OS, and call fsel_input instead (Lattice C does this)

(I haven't used such a system in 10+ years, since I upgraded from a
Mega 4 to a TT, so my recollection may be a bit skewed)

What a hypocrite, considering most of the replies I get are from you.
Whats wrong, couldn't you take the fact that you lost the argument?
Now you are running around telling other people to block my messages.
How funny.

We had a frank and logical discussion about the ST/Amiga, but we
discovered that your knowledge of the ST was laughable and you were
subsequently gutted in the arguments. Now you have nothing better to
do than winge and try to change the subject.

Didn;t I tell you before? Why do you keep coming back? If you are not
a hypocrite, lets see NO MORE POSTS from you about thi sissue. And who
the hell are you to tell people what to read and what to filter? Are
they all stupid? Do they not have a mind of their own? ARe you the
moderator, the high and mighty PERSSON who need to tell the stupid
public what they can read and what they should filter???

Put your own filter on and sod off forever. Don;t keep starting new
"Darkling" posts...

2078. Abusive messages

Newsgroup: comp.sys.atari.st
Date: 2002-03-08 20:58:50 UTC
From: jfhaslam@zetnet.co.uk
Message-ID: <3c892608$0$29610$4c56ba96@master.news.zetnet.net>
Source record: 37132

Hi all!

Another way you can deal with abusive news messages is to view the message headers (for example in Newsie select News Reading Options in the Preferences menu and click on Show Headers on the left hand side).

In the header of the message look for the line containing something like:

X-Complaints-To: groups-abuse@google.com

Then forward the message to this email address and ask them to take action. The Show Headers option must be on when you do this as the people at Google (as in the above example) will use the header to find out about the person making the abusive message.

BTW does anyone know whether Newsie's Killfile works for News? I can get it to work for Email fine (all my mailboxes are managed by this).

Cheers!

James

Source record: 37133

Hi,

I have some sort of speeder inside my falc that I suspect is a powerup2.
What does yours look like? Mine is a little dark green plastic box about
1.5" long, its glued onto the motherboard between the Glue chip and the
memory expansion port. There is a multicolour ribbon coming out of it, that
splits and goes to several different places on the mobo.

You can use gembench to test the system speed. If you use magic/mint/geneva
you can use zbench aswell. The only strange thing I have noticed is that
gembench scores one of my CPU tests at 86% - whether or not the speeder is
active. With it on I get 200% speed on certain CPU functions, and overall
cpu-wise its ~130% of a normal falcon.

As far as MAGTOROM is concerened, I havent got a clue, when I had magic on
my machine I didnt have this program - but Uwe prowls this newsgroup so he
will probably tell you what it does himself.

Message-ID: <a6b9uk$e1h$1@newsreader.mailgate.org>
Source record: 37134

Hello peeps.

I recently did some mods to my falcon (getting it ready for cubase audio), and I had to order quite a few of each component. Now I am done I have spares, and if anyone needs to mod their falcon and cant find the parts they need, I will put together a set for anyone who wants them, for a fiver (£5) including postage anywhere inside europe.

BTW, this is the mod that reduces the headphone and mic levels to standard LINE (the same as your Hi-fi) and also removes the crappy bass-boost. You need to be fairly good with a soldering iron, though the procudures not difficult.

Email me, and dont forget to remove the spam blocker.

For Immediate Release to all Internet and related groups!

The Classic Computer And Gaming(CCAG) Show 2002 is on!

"We, the CCAG organizers, regret that it took so long to officially announce the CCAG 2002 Show. However, we are also very glad that the CCAG 2001 Show did NOT take place after September 11th, 2001. Had CCAG 2001 taken place after 9-11, we would have had to cancel. Because we had used a National Guard Armory for the previous two CCAG's, we were not able to rent the Armory again after the events of 9-11. We have been able to locate and secure a facility for CCAG 2002! We again apologize for the delay, as we were only able to know with certainty, in the past several days. See you all at the CCAG 2002!!!"

CCAG 2002 Staff

The Classic Computer And Gaming Show 2002 will be held on May 25th, 2002 from 8AM till 2 PM. Vendor setup is on the 24th from 5:30PM till 9PM, and from 6:30AM till 8AM on the 25th. Show location is at the St. John Lutheran Church, 11333 Granger Road, Garfield Hts. Ohio, 44125.

Here is our own site for more information and current status of vendors and attendees.

www.ccagshow.com

Table rental is $5 this year, and admission is only $2. The admission fee will also allow you to be eligeble for a drawing at 1PM, the 25th, for an Arcade machine! (You will need a way to take the machine home with you!)

The web site, www.ccagshow.com, has site info, table layouts, map info, etc.

We hope to see you there at the CCAG 2002!

2089. Need help, ST Disk has bad sector

Newsgroup: comp.sys.atari.st
Date: 2002-03-09 02:17:39 UTC
From: pmm217@yahoo.com
Message-ID: <ed91d65b.0203081817.7d8086b6@posting.google.com>
Source record: 37143

I've got a ST disk but when I use the Windows Floppy Disk Copy tutorial, it tells me there are 2 bad sectors on the disk. Is this disk useless or can I save it somehow?

I'd guess inkjets weren't released when the Printer.cpx came out. I
know Derryck got hold of an HPDJ660 colour printer CPX at one time.

Inkjets are very different from DMP's...

> official guidelines, because there were none)?

When I first joined CiX I was using a TOS 2.06 STe and a 2400baud modem. When I upgraded to a 14k4 modem I started using HSModem 4 (I think). It was needed whenever compression and error correction were in operation. The result wasn't necessarily to increase speed, but I certainly found it to smooth out communications to the BBS.

I also seem to remember that Andy Curtis/Frank Charlton were insistant that problems existed on TOS 2.06 machines, due to the number of times connection issues were fixed when TOS 2.06 machines were used with HSModem. The reason was unclear, but the results spoke for themselves.

> I read the docs of a bug fixer for the modem part of TOS, but this
> applied only to TOS 2.05. So is the modem/serial part of TOS 2.06 OK?

Nearly, but not quite. HSModem7 is the best solution and I continue to use it here with Magic.

You need only one program to switch powerup2 on or off.
The performance of this "speeder" is minimum of all what any other
accelerator, like ct2, fx, does. PowerUp is an CPU clock booster.
16 MHz normal, 32 with PowerUp.

> Also there is a small program in the AUTO folder of
> this machine, called MAGTOROM.PRG by Uwe Seimet, what
> does this do?

http://www.seimet.de/atari_english.html

Read_me file:

The program code of the multitasking operating system MagiC is not
located ina ROM area like TOS but in RAM. The RAM contents can be
changed by any program. Buggy programs might destroy parts of the MagiC
code which can lead to a system crash. MAGTOROM runs on Ataris with
MC68030 and ensures that the code of MagiC cannot be changed. For this
purpose MAGTOROM programs the 68030 PMMU. After installing MAGTOROM a
write access to the MagiC program code results in a bus error like
writing to the TOS ROMs gives a bus error as well. You get the best
protection if you place MAGTOROM in the AUTO folder right after the
MagiC booter. MAGTOROM can only protect the complete MagiC code if you
use the program MAGXBO32 as booter. When booting with MAGXBOOT only a
part of MagiC is protected. MAGXBO32 belongs to the MagiC distribution.
As MAGTOROM does not leave any code in memory there should not be any
incompatibilities with programs not using the 68030 PMMU. When using the
virtual memory manager OUTSIDE, MAGTOROM is not needed because OUTSIDE
automatically protects the MagiC code the same way MAGTOROM does.
MAGTOROM cannot be used together with SCSI.RAM by Steffen Engel. Use
SCSIDRV.PRG instead.

MAGTOROM is Freeware, it may be copied as long as this text is included.

> Can I boot up in Magic 6.20 without this? And can I

Yes

> use an altered MAGIC.RAM file from a CT2B system?

No

>> sure there's more, but these are the main ones). Lots (for a
>> "non-mainstream platform") of new software coming out all the time, too.
>>
>You can add : minix, linux, NetBSD, OS9, Omen ...

That depends on one his point of view.
With TOS, MiNT, MagiC and Geneva one can run most Atari compatible TOS/GEM apps, with the OS's you've added to the list this isn't possible. These OS's can only run software which is written specificly for those OS's. The software running on those OS's is mostly ported stuff, and it shows, they lack any compatibility with what makes Atari computing fun, no GEM GUI, no D&D, no Bubblehelp, no OLGA etc... in fact no nothing at all :-/

Cheers from Belgium

Hi Michael,

>I agree, printer drivers are lacking. And NVDI would be the most logical
>choice at the moment to support.

It's the only choice at the moment. Unfortunately NVDI is starting to show
its age. The internal dithering routines of NVDI are ancient stuff by today
standards. Even with support for new printers the end result would be a far
cry from what can be achieved on the Mac or PC with the same printer.

>I have a new Epson printer that is capable of 2880 dpi (which truely can
>do Photo-quality). Epsons (new ones) can do much more than 720.

The NVDI Epson 850 and 900 drivers are capable of doing 1440*720dpi, the
results are quite pleasing as long as one doesn't compare them with the
output from other platform drivers.

>I'd love to be able to use my 2880 dpi resolution with my Atari... But
>Calamus won't cut it, as I need my printer for more than just DTP, and
>saving and printing from Calamus is kind of a pain.

Install the VDI printer module, printing from NVDI gives a much better
result and you don't have to bother about control lines either anymore.
The Calamus light version comes with the VDI module, just try it out...

Cheers from Belgium

Hi Jim,

>Just what is it you are asking for? The last time this topic came up
>here, it was concluded, I think, that Photo Quality was in fact edge
>enhancement.

There's a big difference between what printer manufacturers designate as
Photo quality and what the user conceives as a "Photo Realistic" print.

>Further beating on the greasy stain where the dead horse used to be, one
>might note that an old version of Calamus came with a printer driver
>generator, and that can still be used.

Yes, and the results generated by that program are quite acceptable for
text output. But suppose you want to print a decent looking photo realistic
print of your grandmother, you'll end up with a very crude looking grandma,
none of the drivers generated with that program are capable of coming even
close to what is accepted these days as photo quality. To make things even
more complicated, in Calamus to output a decent looking photo realistic
print one needs more then just a "good" printerdriver.
I've lost count of the hours I spend searching for the best combination of
raster dot/control lines. The guy who wrote the LIN module IMO has sadistic
tendencies !!
Another option is to switch off the rasterization all together and try to
get a quite decent looking print with what is known in Calamus as "ordered
dithering", but one still will have to fiddle with those blasted control
lines... it might be called "ordered dithering" in Calamus but I prefer to
call it "chaotic dithering".

The best results with the Atari Calamus version are achieved with the VDI
printermodule which uses the NVDI printerdrivers and dithering methods. But
(there's always a but...) a simple A4 in TC will eat away 150MB !!, and
since most of us do not have that amount of memory, the only option open is
to use the NVDI spooler, printing that A4 in a 1440*720dpi resolution on a
TT will take forever... don't expect it to be finished under 75 minutes. To
be very clear on this: I did say the "best results on the Calamus Atari
version", it's the best NVDI can do... Use the same printer and CDK on a PC
or Mac version of Calamus and be amazed over how :
1) good your printer is
2) what photo quality "really" means....

>To make things even more complicated, there is fVDI, too.

How and where does fVDI fit in this story?

>So, is what we need already somewhat available, saving and printing from
>Calamus, or is is something else?

Invers doesn't support propriate printer drivers since years, the general
advice given to customers is to use the VDI printer driver. What is needed
in the first place is a new completely overhauled NVDI, NVDI as it is, was
fine 5 years ago, but now it's showing it's age...
There's no new version of NVDI coming, and furthermore it's worth keeping
an eye on new developments. Nowadays it's impossible to buy a new digital
camera which you can attach to a Atari (it's all USB), try finding a new
SCSI scanner somewhere or even a new SCSI CD-Writer which can be driven by
our existing drivers. Printer manufacturers are dropping the centronics port
like a hot potatoe, in a year from now all affordable printers will be USB
only... So this discussion about new drivers is pointless really :-/

>Of course, having had Calamus for years, I just cannot conceive of anyone
>not having it, but it is more than a bit pricy for new purchase. I do not
>know if the light version will run the now-free lower-resolution
>StarScreening module, or the filter module with FM filtering.

The NVDI dithering routines are much better and less nerve wrecking also.
The VDI module is included in the light version, Calamus SL2002 Light gives
the best overall print output I've ever seen on *this* platform, but it is
a far cry from what can be achieved on other platforms, using exactly the
same printer and program....

Cheers from Belgium

There are programs like Disk Doctor that will fix that problem. You can
download such programs on the net. Oh, I am talking about Atari ST
programs. If you do not have one, I would think there are such programs
for the PC available.

Mine is German, "Variables Kontrollfeld, V 1.31modifi"
As I heard from a friend when he gave it to me, some bugfixes were made
on it (?)

Do you want it? I can send it to you...

Best regards, Werner

On my Falcon, I normally use aMail or MyMail. But recently, I've had some difficulty connecting. My ISP's been making changes in the dial-up process, which my Mac can keep up with, but the Atari is getting stuck on for some reason. I haven't figured it out yet. I use my Mac for internet more often anyway and my Atari for the really fun stuff. I normally use Outlook Express on the Mac, which I've already received advice about just today. However, if someone knows how to use Kill files on aMail, I'd be glad to hear it! Thanks!

In message <a6b96rdpo1@newsreader.mailgate.org>, smeg_007@nospam.hotmail.com said:

>As far as MAGTOROM is concerened, I havent got a clue, when I had magic on
>my machine I didnt have this program - but Uwe prowls this newsgroup so he
>will probably tell you what it does himself.

Until he does, here's his README:
~~~~~~~~~~~~~~~~~~~~~~~~
The program code of the multitasking operating system MagiC is not
located in a ROM area like TOS but in RAM. The RAM contents can be
changed by any program. Buggy programs might destroy parts of the
MagiC code which can lead to a system crash.

MAGTOROM runs on Ataris with MC68030 and ensures that the code of
MagiC cannot be changed. For this purpose MAGTOROM programs the
68030 PMMU. After installing MAGTOROM a write access to the MagiC
program code results in a bus error like writing to the TOS ROMs
gives a bus error as well. You get the best protection if you
place MAGTOROM in the AUTO folder right after the MagiC booter.

MAGTOROM can only protect the complete MagiC code if you use the
program MAGXBO32 as booter. When booting with MAGXBOOT only a part
of MagiC is protected. MAGXBO32 belongs to the MagiC distribution.

As MAGTOROM does not leave any code in memory there should not be
any incompatibilities with programs not using the 68030 PMMU. When
using the virtual memory manager OUTSIDE, MAGTOROM is not needed
because OUTSIDE automatically protects the MagiC code the same way
MAGTOROM does. MAGTOROM cannot be used together with SCSI.RAM by
Steffen Engel. Use SCSIDRV.PRG instead.

MAGTOROM is Freeware, it may be copied as long as this text is included.

Uwe Seimet (seimet@chemie.uni-kl.de), January 1997
~~~~~~~~~~~~~~~~~~~~~~~~~~

You should have received this (bilingual) text with the
originalprogram - it is a condition of distribution that the text
file goes with it!

>Replace it with "serial.cpx".

YES! It should allow you to set the bps speed directly, without
having to remember the mappings. The other settings are 8, None, 1.
Also be sure you set FlowCTRL to RTS/CTS.

>-Install "HSmodem" (in the AUTO folder) as this replaces buggy (or poor
>performance) routines in TOS 2.06 with much better code.

Up to a point, Lord Copper (if you haven't read Waugh's "Scoop"
you won't get the joke!) You install the *required components* of
HSModem in the AUTO folder. The details are in the files in the
package, though I have quoted them in a previous message. Normally
DRVIN must run before SCC and both should be near the end of the
AUTO folder, but before STing and Stik. You may also have to run
the configuration program SETTER.PRG and act according to the
prompts, though often the defaults are OK.

>HSmodem supports higher speeds than 19200 baud, but even with ST
>computer that haven't been modified it will improve the data transfer
>reliability.
>-With a modified ST (i.e. RSVE etc. for higher than 19200 baud transfer

> graphics and sound. We're not calling the Amiga shite, infact, we should
> team up as fellow M68K users against PC lamers.
>
> Joshua
>
> Very True.

*sigh....here we go again...There IS a point...The Amiga was better
full stop. The Atari did not excel in sound, it inly achieved a market
superiority in that field because people thought "Oooohh built in midi
ports, Atari must have better sound"...In fact Amiga had beeter higher
quality sound...Every heard the excellent Speedball 2/Xenon II on the
Amiga, and then the sad choppy version of the sound on the ST??

Atari excelled in DTP?? HA..The only good DTP package in those days
was Quark exress, it was king of DTP...The Amiga could emulate a Mac
faster than a real Mac, and run QExpress on top of that...

Amiga's DTP packes like FInal Writer II and The Wordworth series
kicked Calamus's arse...The vast majority of publihsing houses used
Mac or Amiga, ST's were for hobbyist DTP people...

Sure the ST had a 68000 just like the Amiga...but the overall Amiga
design (expandability/vastly superrior grafix/sound/custom chips)
meant that the overall throughput of the Amiga outdid the ST...

BUt I agree, one area we can definitely agree on is lame PC owners
with their glorified 8086 chips and 1960's architecture...

2119. AtariICQ 0.153 released

Newsgroup: comp.sys.atari.st
Date: 2002-03-10 02:02:58 UTC
From: GokMasE <fake_email@spamblock.no>
Message-ID: <Usenet.aeljkcaj@localhost>
Source record: 37072

Hi folks,

Finally we have reached the state were we feel that the program is once again ready for a new release!

Basically, the OVL has undergone some big changes in order to work with the latest version of the ICQ protocol, v8. As most of you probably already know by now, Mirabilis stopped supporting v5 of the protocol in favour for the new one, which in fact is a subprotocol of OSCAR, the protocol used by AOL Instant Messenger. In other words, the OVL has had a massive make over in order to get aICQ working again, and Dan Ackerman has made a wonderful job in implementing all the necessary changes.

In GUI, the list of changes is also quite long, and although most things might not seem like drastical stuff, some things are worth mentioning:

* Word wraps are recalculated if msg window is resized
* Copy function added for incoming area of msg window
* Popups are created faster (significant difference with large popups!)
* Popup icons are now also involved in 3d motion when selecting entry
* Clicking right mouse button will reverse direction of scrolling
* Double click on string in msg window text area calls for StringServer
* Right click on URLs in msg window presents alternatives via popup
* Preventing mouse shape from changing when live dragging window in XaAES * VDI-blits used for scrolling in both message window and contact list (much faster) * Speeded up loading/saving of user info (to HD) quite a bit * Config loads much faster, especially if you got lots of contacts * New shortcut: CTRL+Enter will send a msg and then close msg window

For more details, check out aicq site, and update.txt found in distribution zipfile.

While most things that the old client could do is already supported now, there are a few things that might not.

1) You can't yet create new ICQ accounts
2) Changing what list a contact is on (visible/invisible) might take a reconnect to get into effect
3) You *definitely* need to adjust the server (to login.icq.com) and port (to 5190), else aICQ will lock up tight.

Me and Dan hope that the new release will work out alright for all of you, but should any questions or problems occur, please do let us know, either through this email list, or on the aICQ forum (linked to

from aICQ homepage)

http://aicq.atari-users.net

Have fun, and cu all on ICQ ;)

/Joakim

>
>Excellent! Thanks!

If you (generic, rather than specific) can set kill rules using REGEXP
strings, these should do just nicely:

#NewDarkling
/^NNTP-Posting-Host: 194\.216\.105\.\d+.*$/h

#Jim Brohier
/^NNTP-Posting-Host: 203\.26\.98\.\d+*$/h

A quick scan through my news archive (~30 days) only shows matches for
(New)Darkling and Jim Brohier with these rules.

Regards,
David Bolt

>the TOS image file and loads it into memory.

Yes, there's one on the net available. But I neitehr tried it nor do I
remember how it was called.

>
>By the way, how much memory does something like this steal?

Any TOS will steal as much RAM as itself is big and some plus for screen and
disk handling.

>I've been under the impression that even a standard ST/F/M/E will read
>TOS from the ROM chips, then load it into RAM (simply because ROM is too
>slow to be efficient) -is this correct?

Nope, all ST read the TOS directly from the ROMs. You have always all memory
(without some space for TOS informations and the screen) available.
TOS only gets loaded into RAM if you use a TOS on disk like the first ones or a
boot loader.

You have to put GEMRAM.PRG and WINX.PRG in your AUTO folder, and
(optionally) WINX.CPX in the CPX folder. WINX.PRG must be after
GEMRAM.

If you have TT-RAM memory, you may use ROMSPEED.PRG by Uwe Seimet
instead of GEMRAM.PRG.

The function of GEMRAM is to rewrite TOS from the Read Only Memory,
where it cannot be modified, into the RAM, where it can be modified
(by WinX for example).

ROMSPEED does the same, but rewrites TOS to the TT-RAM, which
additonaly results in a *great* speed improvment.

WinX does not only fix certain TOS bugs (Arrowfix patch) or limitations
(allows to open much more windows, but *not* with the Desktop...)
but also adds real-time window moving, scrolling and resizing -
something that is available in MagiC or N.AES for example.
Real-time window scrolling is very useable, and whoever tries
that will never want to live without it ;-)

Those real-time window operation features work only with TOS 2.06
and later versions (3.06 for TT or Hades, 4.0x on Falcon.)

WINX.CPX is for easy configuration of WinX (which is saved in
WINX.INF file in the AUTO folder). There are separate configurations
for various applications allowed, which is useful with old programs

that might not support all the WinX features (such as scrolling the window contents in an untopped window, AFAIK the viewer in StZip or LharcShell has problems with it.)

After placing WINX.INF in AUTO folder you do not actually need WINX.CPX for WinX to work properly.

And my WINX.INF looks like that:

```
# WINX Infos

GLOBAL= 5-6-7-8-13-14-15-16-

= # GEM-Desk
*= 8-10- # Default

DDELAY= 460,0,1000,2000
WFONT_OFF= 1,10
GADGET_OFF= 0,0
LOADFONT=
```

I don't remember all WinX improvments, but I think real-time window operations (2.06 or more), exceeding the number of windows to 40, Arrowfix patch, possibility to move the windows off the left screen border and "intelligent" redrawing of the window contents are the most important functions. With TOS 1.0 it makes also possible to scroll the window contents when holding the mouse button on one of the arrows in the slider (normally in TOS 1.0 you have to point the slider arrow and click *repeatedly*...)

Hei All.
Is there any good translators Eng to Ger or Eng to Fre. Much that I like reading Collins German/French
dictionaries but I could with a ACC to call upon.

regards

Hallvard Tangeraas <northstar2010@_I-hate-spam_yahoo.no> writes:

: Can someone please tell me more about GEMram and Winx?

: The docs are very technical and mostly in German, but I've gathered that
: they have something to do with loading TOS into RAM, which is (for some
: unexplained reason) needed in certain cases where you want to fix
: bugs/limitations of TOS.

: I've read about (and downloaded) "SHbuf" which is used to increase the
: size of the "NEWDESK.INF" file (the desktop configuration file) for TOS
: 2.06 to 32 Kbytes (the original maximum size being 4 Kbytes).

: As for Winx... I think it has something to do with getting extra
: features in TOS, but I have no idea why/what.

: Can someone lay out the facts for me?
: And most of all.... please tell me how to try this out. The docs aren't
: very detailed about that.

I would not boot without them. Winx gives extra windows, up to 15. It
needs GEMram so it can change the relevant variable. If it has more
features I have not met them.

Hei Cro-Sauron.
There are three main downloadable types that I know of TOSBOX Gemulator and Pacifis.
All three are good enough to do the job. If you would like I can download from some of my pd copies.

True ! WinX is really addictive.

> I don't remember all WinX improvments, but I think real-time window
> operations (2.06 or more), exceeding the number of windows to 40,

> to scroll the window contents when holding the mouse button on one
> of the arrows in the slider (normally in TOS 1.0 you have to point
> the slider arrow and click *repeatedly*...)

- you can move the mouse cursor once you have clicked on an arrow
to control the speed of the scrolling (very nice feature but I think
it only works with programs that were designed to handle it)
and its direction (that works with all programs).
- you can put the up and left arrows next to the down and right arrows
- you can put a window in the background by click on its title bar
- right clicking on an arrow will move the slider directly to its
origin or end.
- you can move/resize a window in the background
- you can "full" a window by double-clicking on its title bar.
- the "close" and "full" button are auto-repeat (not very useful I
think)
- you can have "3D-look" windows on older TOSes
- ...

The last version is 2.3n, which can be found here
http://atari.sh.cvut.cz/ftp/ST/util/winx23n.lzh

But I think that to get started, it'd be better to try an older
version with english documentation.

Hi,

The latest version of Aniplayer is on my site. About the main feature,
now it's possible to play all AVI files encoded in divx4/mp3 on CDs,
just you need:
Memory.
Lot of power (not easy on Atari).
Nevertheless, why not play littles movies...

Regards,

Didier.

> Is there any good translators Eng to Ger or Eng to Fre.
>Much that I like reading Collins German/French
>dictionaries but I could with a ACC to call upon.

John, there are three programs with different approaches:

GEMTrade (Shareware by Mark Wherry - mark_wherry@hotmail.com)
takes German text and translates it word by word to write a file
called filename.eng (where fiename is the name of the original
text file), leaving words it doesn't know untranslated. The result
is a sort of Gerlish IYSWIM.

The other is Arthur, Shareware by Richard Gordon Faika
(rgf@rgfsoft.com or http://www.rgsoft.com) which is a dictionary
only - you type in a word and get back a list of translations
using the word or something like it (you have control of whether
you want only exact matches or similarities as well). This has
loadable libraries for various languages - English-German (or vice
versa) was first but I believe there is (or will be soon) a
French-English one as well. It is accompanied by Bertha, which
lets you modify and supplement the libraries.

Finally I have an old ST-Guide one ENG_GER.HYP by Ralf Zimmerman
(ralf_zimmermann@of2.maus.de). This needs a range of other files
E_G__A.HYP to E_G__Z.HYP which hold the word-pairs in compressed
form. This is the easiest to use - you just put the cursor on a
word and press the [Help] key, and after a short delay get back
one or more translations. This too works both ways - Eng to Ger
and Ger to Eng. A little slow at times, and there is no easy way
to extend the libraries.

Regards, /Peter/

Hello,

Well I have a TOS image file of TOS 1.0. It exists by itself on a disk
and not in any folder. It loads automatically when the computer boots
with the the disk in it's drive.

> Darkling at one point said something to the effect of,
> if you don't read or reply to it, it shouldn't disrupt anything.

What the hell are you talking about Freeman? I post all my messages to the group. I NEVER send individual people posts because I know you ST owners have a delicate temperament. HOw is this disrupting you??? HOW??

> But just
> today I had to search through a long list of "NewDarkling" posts to find
> something worth reading.

I don;t understand....YOu had to search NewDarkling posts to find something worth reading????? I thought you didn;t want to read any NewDarkling posts, so what the hell were you doing going through my posts??

I don;t know what kind of crap ST news reader you are using, but if you simply ignore the post and don;t click on it, it won;t disturb poor little you....

Why did you "go through" my posts? That would imply you actually read every eingle one of them...Why did you not just ignore them and save bandwidth if you can't handle the truth???

> I hate that. It's incredibly disruptive, especially
> knowing that nothing intelligent or worth anyone's time is being said by
> this guy.

Listen you LAMER, so sad little ST owner, I have simply been arguing with people about the merits of an Amiga over an ST and have had a lot of feedback from many ST owners...YOu yourself have nothing intelligent to say...YOu know Jack Shit about the ST/Amiga hardware, you've no idea about the internal workings of either machines, and the vast majority of your posts have been annoying whingings and whinings....WHy don;t you just ignore all NewDarkling posts and leave forever??? I am not forcing you to read or download my messages....

And you are the sad little puppy who started this new whine thread in the first place...why are you going around starting newer threads??? I tried my best to stick to the thread I started, namely "Amiga was always better". Its chumps like you who go around proliferating new threads....Why?? WHY?????????

>
> Just a note... I strongly suggest people just stop replying to these
> idiots (if they are indeed more than one person). Maybe then they'll get the

> message. I've stopped reading these posts altogether,

Oooh thank fuc*ing goodness for that...except I know you are reading
this you twit...SO you have stopped reading the posts...then, since
this is a public newsgroup, why do you keep whinging on about me?? You
are so lame....

> but obviously not
> everyone has.

Yes, people like you still keep going around generating new threads...

> I think doing that is the only way they'll go away. They'll
> get bored because no one is falling for this crap, and go bother the PC
> newsgroup or something. I long for the day when I can open up this newsgroup
> and see nothing but people helping each other and having peaceful, honest
> discussion, like it used to be.
>

In that case why did you go around creating new Darkling threads?? I
started the "Amiga was always better" thread and stuck to it. I did
not go around wasting newsgroup space with multiple threads...I stuck
to my one thread...But wait...being an ST owner, none of this is
getting through your cranium so I'll stop now...

BTW is anyone else being FORCED to read my messages, like they just
appear in your inbox even though you don;t want them to??

I have nothing to do with this Jim Brohier guy or SInclap...

> Mike Freeman
> nameerf@flash.net

Darkling.

It is, but some trolls are fun to play with before dumping them back out in the cold. You, on the other hand, aren't worthy of the title troll. It's a struggle to call you a troll-wanabee. Maybe after a few decades, and/or when you get your IQ above zero, you can put forward your application to be a troll again. It'll probably get turned down again, but there may be a sliver of hope for you.

>Oh I forgot, you are all ST owners

You may want to have a peek at my .SIG, or look at my headers, to see what machines I have. But for the terminally clueless, i.e. you, I don't have any Atari machines any longer.

2143. Falcon Just Sold to TOS developer

Newsgroup: comp.sys.atari.st
Date: 2002-03-11 04:35:01 UTC
From: rustynutt@hotmail.com
Message-ID: <fc53daf3.0203102035.2f01d552@posting.google.com>
Source record: 36997

Just thought I would let you guys know that I just sold one of my "stock" Falcons to a programmer whose software you might recognize. He and a fellow cohert developed "Partner ST" and a few other applications back in the late 80's. They went on to write a few other applications for the PC, then, as most of you Atari developers will know, needed to put food on the table.....
But....the good news is he is retired, and can't wait to get his hands on this Falcon. Don't think he has visited this group in a while, if ever, might not want to get involved with all this flame crap either (so you hackers take care of Sinplop and DarkTurd).
At any rate, hell of a nice guy. If you don't know who he is, i'm not saying until he gets the Falcon and give some feedback (make sure he doesn't feel ripped off), but from the sounds of it, he is reliving what some of us felt back in 1992 waiting for the "Bird" to arrive in the mail.
I set him up pretty well:)
Mike

2144. New MyMAIL version 1.55

Newsgroup: comp.sys.atari.st
Date: 2002-03-11 06:56:11 UTC
From: epkerha@epk.ericsson.se
Message-ID: <a6hkebrsp1@newstoo.ericsson.se>

```
Hi all !

New version of MyMail (1.55) at my homepage.
http://www2.tripnet.se/~erikhall/programs/mymail.html

Some of the News/Changes in this version:
- Editor bugfixed
- Added support for "mail read receipt".
- New status icons in the main window.
- Bugfixes of the redraw of mailbox contents in the main windoww
plus some rewrite to get faster code/updates.

Best Regards
Erik Hall

> upon as a "TOS loader" as well?

No, GEMRAM reads TOS from ROM *only* and rewrites it to RAM. It is
not a TOS-loader. Maybe a "TOS-rewritter" ;-)

Then, if you start WINX.PRG from the AUTO folder, it will try to find
and recognise TOS in *RAM* (placed there by GEMRAM) and patch it.

But if you start WINX.PRG from the Desktop, it will display a dialog
box with an option to read a TOS.IMG file. After reading the file
it will do the modifications and *save it* to disk. You would still
need a separate TOS loader to use the TOS different than the one
in ROM (i.e. from the TOS.IMG file).

> > WinX does not only fix certain TOS bugs (Arrowfix patch)
>
> What exactly is this arrow bug?

It is only in TOS 1.0 and 1.02 AFAIK.

> What is it exactly, and what does it affect?

Sometimes when you click on an slider arrow once, the window contents
are scrolled two lines instead one.

> You mean: as long as the TOS image you load is 2.06 or above? Surely it
> can't matter which TOS version is inside the machine's hardware (ROM

> chips) as GEMram is used to load the TOS image anyway.

It *does* matter, because GEMRAM gets TOS from ROM, not from a file.

> > WINX.CPX is for easy configuration of WinX (which is saved in
> > WINX.INF file in the AUTO folder).
>
> I could never get the CPX to recognize Winx. All I get are messages
> saying that Winx hasn't been loaded.

What is being written on the screen while GEMRAM and WINX are
executed from the AUTO folder?

I remember WINX didn't worked on my 520ST with TOS 1.0, which
was in fact a bit non-standard one, burned into EPROMS from
I-dont-know-where ;-)

WinX and Gemram only work with certain TOS versions, mostly
German ones :-(They do work with the English version of TOS 2.06
though, but I'm not quite sure about the American one. Forget
about the French or Spanish ones...

> Are you saying I need to copy this setup file in the AUTO folder?

You might because the standard WinX configuration is a bit weird ;-)

> always thought that the CPX modules created their own setup files after
> first accessing them.
> But since I get a message saying Winx isn't installed I don't think this
> is the problem.

I forgot about one very important feature: together with ALICE
WinX enables window iconify (TOS 2.06 or more).

I have tried the latest Steem which is the only emulator (other than STonx
from way back) which works on Linux. But Gemulator still the best for
serious programs, on a PC. And it is also free from Emulators Inc., they
only charge for Mac emulators.

2150. Which system software for aranym was: emulator for PC

Newsgroup: comp.sys.atari.st
Date: 2002-03-11 14:44:08 UTC
From: Ludwig Maetzke <Ludwig.Maetzke@Triaton.de>
Message-ID: <3C8CC2B8.ACFDF49@Triaton.de>
Source record: 37004

Hello Ctirad,

> The best "emulator" for serious programs is Aranym.
Oh yes, I'm convinced that aranym together with the coming Mini-Linux designed for it is (or will be) the best way to run Atari programs on an Intel/AMD-PC.
Concerning the optimal configuration of aranym, I have some questions:
1. I can't do without singletasking because else f. e. the PurePascal debugger crashes.
2. AFAIK PurePascal and perhaps some other programs doesn't run with MinT? So must I do without MinT? Which disadvantages do I get then?
3. I want to get access to the ext2-files of the Linux host system with Atari programs.
4. If possible, I want to change resolution and colour depth without reboot, because my programs don't all run in colour mode (f. e. Public Painter Monochrome)
How do I have to combine which system software to serve to all this demands? Isn't there a file system driver for standard TOS that enables access to ext2-partitions or Minix disks without MinT? MagiC has single tasking mode, but are there any Minix- or ext2-drivers that can be used with it? NVDI 4/5 together with MagiC/Atari and MagiC/PC is reported to enable changing resolution without reboot. Is this possible with the free fVDI, too?
Perhaps, for me it could be useful to combine Geneva with the Atari-AES 4.1?
Thanks for every tip.

regards, Ludwig

> image of your desired TOS version: these images are lying around on the
> internet, for example try Little Green Desktop.
> the question of course is..... where do I find "TOSBOOT.PRG"?
I don't know a TOSBOOT.PRG. Of course it would be useful to load a TOS
Image from a hard disk and not only from a certain boot disk. If you are
pleased with a boot disk, make one this way:
1. You ask Edward S. Baiz who answered in this thread before to send the
boot sector file of his disk to you. Perhaps he can clip the boot secor
with a disk utility.
2. Format a disk with the *same* parameters as Edward's disk (sectors
per track, numbers of sectors for the FAT etc.)
3. Replace the boot sector with Edward's one with a disk utility.
This may be complicated and perhaps there are formatting programs that
have an option to write a boot loader. AFAIK Claus Brod wrote one
distributed with his book "Scheibenkleister" ("disk paste").
Perhaps the american.prg is a cracked version of TOS 2.x that puts a
TOS-2-desktop on an older Atari ST. I remember a similar newdesk.prg.
TOS 3 doesn't run on ST's for it is compiled for 68030 CPU's.
100% legal TOS 2.06 Images are f. e. distributed with the CD that comes
with July/August issue of the German Mac Live journal. For only 5 EUR.
I'm proud to have such a file for use with the TOSBOX emulator. Perhaps
Thomas Raukamp from the Falke Verlag will serve you with an Image file
for a small fee.

regards, Ludwig

> Concerning the optimal configuration of aranym, I have some questions:
> 1. I can't do without singletasking because else f. e. the PurePascal
> debugger crashes.

Aranym currently uses TOS4.04 ROM, so no problem here. Single mode will be most probably possible
also in future, because guys from EmuTOS team want to do complete TOS replacement (with VDI, GEM and Desktop), not only a Mint loader.

> 2. AFAIK PurePascal and perhaps some other programs doesn't run with
> MinT? So must I do without MinT?

I don't know anything about Purepascal, because I never used it. AFAIK there
was only problems related to debugger and perhaps also higher CPU than 68000
(or that was Devpac ??), I really don't know.

> 3. I want to get access to the ext2-files of the Linux host system with
> Atari programs.

No problem, this is already possible for a long time.

> 4. If possible, I want to change resolution and colour depth without
> reboot,

It's possible in VIDEL mode, for fVDI see below.

> because my programs don't all run in colour mode (f. e. Public
> Painter Monochrome)

Ooops, this is not clean GEM program, is it ? Well, you can run such
programs in VIDEL mode, but on the other side, do you really think that
those programs are so important for anybody with truecolor an a desktop ?

> How do I have to combine which system software to serve to all this
> demands? Isn't there a file system driver for standard TOS that enables
> access to ext2-partitions or Minix disks without MinT?

There is a driver for Metados (Betados) which allows you to use any alredy
mounted host-fs disk device as an TOS partition.

> tasking mode, but are there any Minix- or ext2-drivers that can be used
> with it? NVDI 4/5 together with MagiC/Atari and MagiC/PC is reported to
> enable changing resolution without reboot. Is this possible with the
> free fVDI, too?

Teoretically yes. The resloution and color depth parameters are stored in
config file, so you may change it and then restard fVDI from the Desktop.
This is sure not very good and reliable solution and maybe it doesn't work

at all ;)
Anyway, the utility which will be able to switch the graphics modes on the fly is planned.

> Perhaps, for me it could be useful to combine Geneva with the Atari-AES
> 4.1?

I don't think this is a good idea. The FreeMint +N_aes (or XaAES, but there is still some bugs) is the best solution if you need a modern TOS compatible multitasking OS. If you want a better compatibility, you may use TOS4.04 + fVDI, which gives you the same level of compatibility as an TT or F030 (without sound and DSP) with a graphics board. Anyway, you should start think what you really want. The very fast TOS compatible machine with USB/Firewire/Ethernet/TVtuner/whateveryoucanconnectintopc or only an improved ST emulator.

Ctirad

MiNT (FreeMiNt to be strict :) needs special debbugers that are suitable for
multitasking envirment, and only few are suitable for it (Pure Pascal
debugger isn't). But anyway, Pure Pascal works, but I wouldn't reccomend it.
It is not system-clean (especially CRT module). Other Pascal compilers are
even worse (anyone wants to port Free Pascal Compiler to atari?). What I
would recommend is swithing to C, becouse it is more portable and fully
suported by all enviroments you can run on your Atari :)

My CT2b performs badly with external SCSI devices like my harddisk and CDRom. I did a benchmark test with Zbench. Compared to the CT2b Falcon that is used as a reference the HD-accesstest scored ca. 2.5 %. First I thought my system was hanging. Also reading CD-Roms with my 4-speed TEAC CD-writer gives trouble, especially with big files. I'm using HDDRIVER v7.71 as driver. Are there ways to improve my CT2b's scsi performance ?

Martin

2162. EtherNE: Ethernet, STing, MagiCNet, MINTNet, with ROM port and ACSI adapter

Newsgroup: comp.sys.atari.st
Date: 2002-03-11 23:07:39 UTC
From: Thomas Redelberger <redetho@gmx.de>
Message-ID: <3c8d3952_1@news.arcor-ip.de>
Source record: 37015

Dear Atari fans

If you are looking for ethernet access for your Atari (Mega) ST, STE, TT, Falcon please have a look at my web site and download the new EtherNE package

http://home.nexgo.de/thomas.redelberger/prj/atari/download/etherne.zip

This includes and extends my former EtherNEA solution and adds a Cartridge Port (ROM port) adapter due to Lyndon Amsdon and me plus driver support for STing, MagiCNet and MINTNet.
And: it is free under GNU license!

Cheers
Thomas

>

A typical patch needs to move a instruction out of the code to be patched
to the code of the patch elsewhere in ram.
This makes room in the code to be patched for a jump instruction
to the patch.

Bad luck if the code to be patched is in rom. ;-)

The only solution is to move all the rom to ram.

If the offending code is called via a system vector in ram, then there is no problem.
You simply replace the address in the vector to point to the patch.

The latter kind of patches are those small programs that you must put in the autofolder.

A fileselector (or a complete AES ;-) can be seen as such a patch :-)

Only one of the drives in the tower was owned by Simon, The machine was
bought from new by me (Kevin) as said on here just one prg turns powerup
on or off. Magtorom seemed to occasionally help in the event of a crash and
not take the whole system down and offer a recover

AIRC, the CT2b has it's own DMA buffer. Lost the installation diagram
a long time ago, but those docs are likely in Roberts "DoitF030" if
you don't have them.
Personally, I would install the last buffer recommended by Atari, and
go as far as to hand route a shielded wire to the DMA chip. There is a
spot on the trace near the clock in pin that makes a dogleg turn. The
trace should be cut just after that (very carefully), scrape away the
resin, and make the connection at that point. The DMA line is somewhat
tied to the FPU clock as well (whats the technical term, through
resistance on the board?), so that seperates the clock signal from the
rest of the main board. Some accelerator boards work better if a
resistor or capacitor is tied to ground from that point as well. You
might be able to trace back and see what the CT2b is using, by pass
it, and do the same near the clock in pin on the DMA. The Nemisis
buffer works pretty good on all but the most picky Falcons. High color
mode is hard on SCSI performance.....
But the best fix is to get hold of Alex at ATY Computer and let him do
the mod. Best in the west.
Mike

2167. FS: Motorola 68060 Processors (affordable)

Newsgroup: comp.sys.atari.st
Date: 2002-03-12 04:23:54 UTC
From: Vernal Elm LLC <vernalelm@nospam.yahoo.com>
Message-ID: <upfj8.8865$P4.724023@newsread2.prod.itd.earthlink.net>
Source record: 37020
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Professionally Recycled Motorola 68060 Processors

We have acquired another stock of perfect condition FULL 060 processors.

Here are the details:

Motorola 68060/50MHz Processor
-FULL Version including MMU (memory management unit) and FPU (math coprocessor)
-Professionally recycled
-Full refund/replacement guarantee
-Perfect for Amiga 68060 and Atari accelerator cards (Phase5, DCE, GVP-m, Apollo, QuikPak, DKB, etc.)
-Ideal for the upcoming Falcon CT60 board, as well as Milan, and Hades (Medusa) systems
-Well suited for overclocking

Price: $105/each
Quantity discounts available

E-mail us at vernalelm@NOSPAM.yahoo.com

Remember to remove the NOSPAM. after the @ sign from the address before sending a message. Mail server should be just "yahoo.com".

You can save a lot of money by buying your 060 accelerator board or system without the CPU and installing one of these. We are a trusted source for quality processors, with many customers within the Atari marketplace, including Czuba Tech.

If you're not familiar with the recycling process, many companies specialize in chip recycling. They have machinery which safely removes these chips from the sockets of working boards. They are then sold in bulk to distributors and OEM manufacturers. Their lower cost makes them available for products (such as Amiga and Atari boards) where the list price of over $500 for small quantities of new 68060 processors is not possible.

Semiconductors tend to last a lifetime, so these products are regarded as new quality. You will receive the same performance as that of a new processor. They are fully tested at the recycler before packaging, and we guarantee them individually with a refund/replacement guarantee.

Feel free to ask us any questions you may have.

Thanks!

> v7.71 as driver. Are there ways to improve my CT2b's scsi performance ?

I have a CT2b Falcon with an internal SCSI HD (in tower) and external
CD-ROM, CD-Writer and A4 Scanner (all SCSI) and I've been very
satisfied with SCSI performance. Although I had a clock patch done
long ago there always were occasional problems at HD-recording or
copying of large quantities of files. Since the CT2b has been
installed there never was any SCSI problem anymore.
BTW, I use HDDRIVER v7.81 but I did the upgrade to 7.81 only because
I needed the feature to access IDE HD >8GB. But recently Uwe Seimet
told me that there sometimes were troubles when using ExtenDos on a
CT2b Falcon. In that case upgrade to HDDRIVER 8.1 would be the
solution.

The best (only ?) way to use newer inkjet printers seems to be to
install NVDI 5.

Gerhard

2170. Help with AdSCSI Plus ST

Newsgroup: comp.sys.atari.st
Date: 2002-03-12 08:33:03 UTC
From: eilersj@gmx.de
Message-ID: <43a29251.0203120033.793daaaa@posting.google.com>
Source record: 37023

Hi,

some days ago I "blew" my AdSCSI Plus ST controller by conecting
12V to the 5V pin. (ARGRRRR, these old case had a powesupply with
a yellow 5V and a red 12V cable...)

I replaced all the logic IC's 74xxx, but it still didn't work. So
I am sure, I destroyed the GAL or there contents.
I mailed ICD. They were very friendly, but it seems, they lost the
GAL-listings, too.

So, is there anyone out there able and willing to find out the GAL
listings (I know it's a bit hard because the security fuses are blown)
and mail it to me?
I could show you the mailing with ICD so you can see they "encouraged"
me to get the listings even if they are secured in the GAL's (and
not "stealing their property")

Thanks

Joerg Eilers

(comp.sys.atari.st)
Hallvard Tangeraas wrote on Tue 12-03-2002 02:15 (GMT):

> One question: is GEMram of any use on its own?

Sure! You can use it to set environment variables.
Just add a file called gemram.env in your auto folder. Mine as an
example:

```
# GEM-Environment
NOS_ROOT=i:\nos
TZ=FST-2
BUBBLE=C:\ACCS
PATH=C:\ACCS
GEMJINGPATH=C:\ACCS\GEMJING.ACC
LDGPATH=C:\GEMSYS\LDGLIB
```

Bye,
/Pascal/

I would prefer Geneva or MagiC because they offer multitasking and a
singletasking option for older programs like PurePascal which are not
further developed but still important.
If ext2- and minix drivers for MagiC are available I would do with it
else with Geneva.

: Gerhard

Older inkjet printers had many operating modes, one of which was
"set raster mode". New inkjet printers have one operating mode,
and no others. It is raster mode only. If you use a program that
outputs in raster mode, sending dots, not characters, to a
printer, it should work with a new printer.

Fit your falcon with an "clock patch" (hardware patch)

Avaiable in some designs.
Best results i got with "74F04" on any falcon any time.

First have a look to four gal chips straigt below keyboard.
If you doasnï¿½t found an 74xxx chip piggy packed on top of U63, your
machine needs an clock patch..

ANY falcon had a upper limit of 1.8 Kb/Sec SCSI (DMA) transfer.
More isnï¿½t avaiable.

(Anyone should constuct a new DMA/SCSI interface) :)

Hmm, my host adaptor is an ADSCSI. I have a GAL programmer so as long
as they didn't code lock their devices I may be able to download the
logic. I'll have a look and would also be able to burn you a GAL too.

Hi Robert,

Under CT2B the four PALs U62/U63/U67/U68 are removed, because the CT2B
logic replaces this chips so the clock patch isn't needed. Normally SCSI
problems not exist with the CT2B.

Regards,

Didier.

I don't have PRINTER.CPX at all: I must have binned it long ago.

When I got a HP LJ4 printer, I found (somewhere) <HP_LJ4.CPX> by which
I could configure how printing turned out. This is now redundant under
NVDI, which has <NPRNCONF.CPX version 5>, but I can't remember if NVDI
works in plain TOS (without MagiC or other).

Charles.

It does... I would say: it is *essential* in plain TOS, not only
because of the printer drivers, but also to make the graphic work
in an acceptable speed. Running Atari without NVDI is a hudge
misunderstanding ;-) and everyone that ever used NVDI will
agree here.

I have a TOS 1.0 disk used on an original ST, will it work on an ST with tos
in rom?

>> Painter Monochrome)
>
>Ooops, this is not clean GEM program, is it ? Well, you can run such

It was mentioned in a later email that Public Painter Monochrome
appears to be a normal GEM program, but that its output gets
distorted in colour modes. That distortion can only come from
improper use of, of bypassing of, the VDI, so it is by definition
not a clean GEM program.

>> with it? NVDI 4/5 together with MagiC/Atari and MagiC/PC is reported to
>> enable changing resolution without reboot. Is this possible with the
>> free fVDI, too?

There are two main problems with resolution change.

First, there is no normal VDI function for changing the graphics
mode at all. That alone makes it a bit difficult. ;-)
The only way is to close the physical workstation and open another,
which I assume is what the desktop does when you ask it to change
graphics mode (it does not do a reboot).
If you modified the FVDI.SYS file appropriately and then closed down
and reopened the physical workstation, this could have worked with
fVDI too. It does not yet, however, since fVDI will not let you
close the physical workstation...

Second, the AES needs to know about the current graphics mode, and
at least the normal one can not be forced to do that.
The same applies to any normal applications that might have stored
information about the current mode.
Like above, this is a problem that does not require an actual
reboot unless you're using fVDI, though.

>Teoretically yes. The resloution and color depth parameters are stored in
>config file, so you may change it and then restard fVDI from the Desktop.
>This is sure not very good and reliable solution and maybe it doesn't work

Actually, that is supposed to work fine, but you need to take care
with FVDI.SYS (some options need to be active when fVDI is booted and
disabled when it's run from the desktop).
I've often started fVDI in 1024x768x16bit mode on my Eclipse from a
monochrome 640x400 desktop. The AES does get very confused, however.

It is not really something I'd recommend doing. ;-)

>Anyway, the utility which will be able to switch the graphics modes on the
>fly is planned.

Internally, fVDI has no problem at all with changing resolution (or
colour depth, if using a driver that implements more than one) on the
fly. A fix for the inability to close and reopen the physical
workstation is on my TODO list.

Hi Hallvard,

Have a look at the site again. You don't need find TOSBOOT.PRG, as there is a program called seltos, which does the same job. The program you need is on the same site! Scroll down a bit and you will find a link for seltos. I tried it today and it loaded the uk version of TOS 2.06 successfully on my 4MB STe.

Hope that's what you were looking for,

-Bill.

2198. Running programs on TT030

Newsgroup: comp.sys.atari.st
Date: 2002-03-13 06:20:56 UTC
From: 1 <1@a.com>
Message-ID: <cdCj8.6089$dn2.117@nwrddc02.gnilink.net>
Source record: 36902

I recently ran into a problem trying to use the 7800 developer program DLOAD.TTP.

This is a program used to download 7800 game code to a 7800 developer cartridge. The program hangs and just sits there on my TT030. But when I run it on my 1040STF with TOS 1.0 or 1.4 it works fine (communicates with the cartridge through the printer port just fine).

Any suggestions on how to make this program function on the TT030?

I got one suggest to remove the TT Fast RAM board from my machine. The TT030 has 4MB of ST RAM and 16MB of TT RAM. 19 inch B/W monitor.

Thanks,
Glenn

Yes it will. Any ST with TOS in ROM is able to boot a diskbased TOS.
This is quite often handy for games that do not work with newer versions of
TOS.

It sounds that some parts of the cartridge programm contain some 68000 only instructions.

Suggestion : only plug the cartridge without starting the necessary software (if you can) then dump the code in the cartridge to see what's wrong.

RS232 is the cheapest way. Get a terminal program that can handle
filetransfer protocols or use a pure file transfer utility.
You will need a nullmodem cable and an adapter because the ST has a braod
RS232 port while most PCs have a small 9pin one.
DOn't forget to install a RS232 patch on the ST end as well because teh
serial routines in TOS1.4 are buggy.

Drop me a mail if you want a ready prepared transfer disk :)

Since nobody else asked the dumb question I have to ask it myself.
I have 24 GB of HD space on my Falcon and since the restrictions under
TOS 4.04 don't let me use the whole HD space as TOS partitions I used
some of it as two big ext2 partitions. Until now I only could access
these under MinT/N.AES. Now could I use that driver to access these
ext2 partitions like a TOS partition under TOS thereby bypassing the
1GB/partition limit of TOS ?
In times where the tiniest IDE HD one can buy is 20 GB such a
'TOS extension' would sure be a great thing for guys like me that
still use original Ataris !

TOS 4.04 allows to have 2GB partitions

> In times where the tiniest IDE HD one can buy is 20 GB such a

That is very good idea, at lesast FAT32 driver would be very nice

Thanks a lot!!!
I know someone with a GAL programmer, too, so
I think I would be able to "get them burned", if I
only had the listings. Hopefully the GAL's are not
protected, but I heard different answers to that
question...

Once again thanks for your affords!

No. The hostfs driver for Aranym use the host OS to access the filesystem.
But it should be possible to write an ext2fs driver for MetaDOS. You just
need to find someone who's willing to do it ;-)

An even cheaper and simpler way is to just use a floppy ;-) He has TOS
1.04, so a PC would read his floppies directly.

No. The driver is only for Aranym and cannot be used in any normal TOS
machine.

My 2 cents; I had difficulty with doing recording over the scsi on my
CT2B. I did the installation myself, and although I sent it to 2
people here in the USA, no joy! Then I sent the mother board to
Rudolphe, who corrected my poor installation, and it has worked
flawlessly ever since. I know that sending things to france may be
difficult for some, but not harder than for me in the USA, and it was
worth it. You may need to investigate the installation!

Before you try yanking boards, see if messing with the binaries prg header will solve it. You can adjust the binary so it loads into STram, it's possible it's loading into fast ram. You need a little tool called prgflags.prg that is available at most ftp sites.

Hi

> Unless you are very lucky, they are locked - I checked several ICD adapters.

IO just checked but mine is actually an ICd Link, which contains a
CPLD, small Mach one. I think this was probably an upgrade from the
AdSCSI which combined all logic into this one chip. Sorry Joerg.

I have a CD-ROM Pionner 10X, a YAMAHA 8424S, and a ZIP 100 Iomega drive
who works fine on my CT2B card. This is a part of the documentation from
the www.czuba-tech.com site:

SCSI transferts / AUDIO setting

When the Turbo mode is running you have to check the SCSI transferts.
It is the same procedure than with IDE HD.
Firstly use CC-TOOLS to test.
After, check a copied big ZIPped file (at least 5 MBytes) from the IDE
to the SCSI in 640*480 TRUE COLOR mode (important to respect this
configuration : CENTscreen is already installed !).
If there is no error, you can think that the SCSI is OK.

If not, be sure that the SCSI chain is correctly set :
Do you know the RULE for SCSI ?
You MUST put a terminator on the LAST PHYSICAL peripheral of the chain.
All the other peripherals MUST NOT have terminator !
There is only one way to be sure of that : open the box and check the
terminator strap/setting on the electronical boards or behind the
peripherals like CD-ROM.

Follow this point seriously because a major part of
the vendors don't know the SCSI rules and install SCSI material inside
case/box without to remove the original terminator on the peripheral.
If there is more than the chain's end terminator, the data transferts
could be altered even if they were good in normal mode several months
ago !

The AUDIO quality has to be listen : check for crackles with official
good software (not demos or stupid mod players that may badly programmed
!).

If you have problems with SCSI and/or AUDIO, you have now to modify a hardware setting ON the CT2 :

There is 4 squared pads before the CPU of the CT2 just between 2 small 14 pins chips. The 2 left pads are connected together by a very small track.
You have to cut this track and put a solder jumper on the two right pads.
You have now a new SDMA timing and have to do again all the SCSI and AUDIO tests.

Note that this modification and the add of a HE14 connector on the left forward corner of the CT2 to light a panel led, are the only ones that cannot cancel the warranty.

If the problem stills to be, please contact Rodolphe Czuba :
rczuba@free.fr or visit
www.czuba-tech.com

[Disclaimer: It's been a while since I toyed around with booting 2.0.6
on a 1040STF. The German magazine c't had an article about relocating
TOS for the PAK 68020 upgrade, but I cannot look that up now]

The problem with booting a TOS image is that the image has to be
relocated, i.e. absolute references (loads, jumps, subroutine calls) to
locations inside the image (and only those!) have to be adjusted for the
new location.

As the image itself has no provisions for the job, your loader comes
with large tables that describe relative offsets into the image, and how
the addressed item should be adjusted. As I understand it, setting up
those tables - they differ from image to image, depending on language
and release - is a matter of educated guesses and trial-and-error.

HTH,
hauke

Hi, Hallvard;

I suggest you take a look again at the TOSPATCH utility which has been
mentioned several timesand which you said you had... You have to:
* Get yourself a TOS2.06 image named TOS.IMG (German one, but Swedish
may possibly do, too);
* Edit file RELOC206.FIL so that you remove the comment from the line
specifying the amount of RAM in your computer;
* Run TOSPATCH.TTP and feed it the name of RELOC206.FIL
* Put the modified TOS.IMG (result output from TOSPATCH.TTP) to root
of the boot disk (it may be a good idea to put the original TOS
image on a different location, so as not to be overwritten).
* Put AUTO_206.PRG (TOS-image loader) into AUTO folder so as to be FIRST
(or first after a boot-selector program):
* Reboot... The computer will load TOS image, then REBOOT again by itself
and then the Atari logo should appear in the corner, etc. etc.

Alternatively, instead of RELOC206.FIL you may use another of the control
files supplied with TOSPATCH, e.g. the largest one (F206_REL.FIL) and
activate many other patches, such as SHELLBUF or WINX features- in that
case you do not need GEMRAM, WINX, or you may make the patch that will
make the loaded TOS image reset-proof, etc. Note that some patches are
incompatible with some others- e.g. you can do ARROWFIX or WINX but not
both because the arrow-patch is already included in WINX patch.

Btw. there are other TOS-image loaders which work on their own- you don't
have to specify any relocation information. One has been made by Pera Putnik,
but I do not know the web location or if it is still there. I also came
upon a couple of loaders which did NOT work correctly e.g. after loading
TOS image with one such faulty program, some desktop menu items became invisible.

>I'd like to know more about installing TOS 2.06 from so called

>By the way, how much memory does something like this steal?

TOS 2.06 in RAM will take slightly less than 300KB, IIRC. In fact,
the image is 256kB and I suppose that housekeeping needs are the same
as with ROM-based TOS so that only the image size should count.
So, let's say- between 256 and 300kB.

>I've been under the impression that even a standard ST/F/M/E will read
>TOS from the ROM chips, then load it into RAM (simply because ROM is too
>slow to be efficient) -is this correct?

No, this is not correct. On a ST-series machine ROM and RAM are accessed
at the same rate and there would be no benefit, speedwise, in moving
the OS to RAM. On machines such as the TT, an operating system in Fast-RAM
should be significantly faster, because Fast-RAM-access rate is faster
than ROM-access on that machine and the CPU is fast enough anyway.

An interesting situation is possible with the ST-series: if a hardware
accelerator is installed (the simple, inefficient one, which speeds only
the CPU for internal operations to 16MHz), overall speed gain is about
20% but if a simple modification of the acceleration circuit is made,
which would keep the CPU on 16MHz while ACCESSING THE ROMS (RAM access
must be kept on 8MHz because of several factors), an overall speed gain
of about 40% can be obtained. So, in this case, an OS operating
from ROM would be faster than one operationg from ST-RAM. In order for
this to work, one must use fast ROMs (i.e. 120ns EPROMs or even faster
other chip types).

While this is mentioned, there is lots of sites with useful info on them that people have just closed. I am happy to host sites for people that can not be bothered with them anymore, I will only leave them in their current state (as I have no time for the up-keep) on one of my servers, I will simply make sure they are available to the public. If anyone knows of people with these kind of sites then please point them in my direction.

For that matter I am happy to host any Atari sites that people may want put on the net for free (unlimited space, etc), however I can not have any copyright software, porn, etc. Just drop me a mail.

Elliot

Hi!

I can recommend a package called STTRANS. It has a file transfer GEM
programm for the ST and a counter part for the PC. The PC program is for DOS
but I used it under Win95 in the DOS box.
Before I had ethernet I had backed and restored up my complete harddisk
(40MB) with this tool, so I am confident it works with large directories,
big files...

I also propose to run the package HSMODA07 to fix the buggy RS232 of TOS.

I agree with Jo: if its <700KB using a disk is faster an less hassle.

Drop me a mail if you like those packages sent.

Cheers
Thomas

I don't know anything about terminal programs on PC's, but on the ST you
could use Connect.

Ghostlink is the best way IMO. It uses a nullmodem cable RS232. Speeds are going to be 19200 only because of the ST but on the Falcon I got 115200. It's available at ftp.lip6.fr.

Joshua.

If you want to transfer many files then I would recommend that you get a
copy of
of paracp, but you will need to make up a lead.. Look at
http://joy.sophics.cz/home.htm for details.

Very fast, will do multiple file copies. I made my own lead by hacking a
standard
printer lead by removing the Centronics plug and replacing with D Type.

Hi All

Neil Chester <neil@adel6.freeserve.co.uk> wrote:

> control whether the Powerup2 is On or Off but I
don't
> know whether this affects the performance of the

You need only one program to switch powerup2 on or
off.
The performance of this "speeder" is minimum of all
what any other
accelerator, like ct2, fx, does. PowerUp is an CPU
clock booster.
16 MHz normal, 32 with PowerUp.

I was hoping to upgrade this machine with the
forthcoming CT60 upgrade.

> Also there is a small program in the AUTO folder of
> this machine, called MAGTOROM.PRG by Uwe Seimet,
what
> does this do?

http://www.seimet.de/atari_english.html

Read_me file:

The program code of the multitasking operating system
MagiC is not
located ina ROM area like TOS but in RAM. The RAM
contents can be
changed by any program. Buggy programs might destroy
parts of the MagiC
code which can lead to a system crash. MAGTOROM runs
on Ataris with
MC68030 and ensures that the code of MagiC cannot be
changed. For this
purpose MAGTOROM programs the 68030 PMMU. After
installing MAGTOROM a
write access to the MagiC program code results in a
bus error like
writing to the TOS ROMs gives a bus error as well. You
get the best
protection if you place MAGTOROM in the AUTO folder
right after the
MagiC booter. MAGTOROM can only protect the complete

MagiC code if you
use the program MAGXBO32 as booter. When booting with
MAGXBOOT only a
part of MagiC is protected. MAGXBO32 belongs to the
MagiC distribution.
As MAGTOROM does not leave any code in memory there
should not be any
incompatibilities with programs not using the 68030
PMMU. When using the
virtual memory manager OUTSIDE, MAGTOROM is not needed
because OUTSIDE
automatically protects the MagiC code the same way
MAGTOROM does.
MAGTOROM cannot be used together with SCSI.RAM by
Steffen Engel. Use
SCSIDRV.PRG instead.

Next question, what's the difference between MAGXBOOT
and MAGXBO32? I once found I couldn't boot with
MAGXBO32 on a CT2B Falcon running 6.01, I have yet to
try again with 6.20!

> Can I boot up in Magic 6.20 without this? And can I

Yes

I have found this to be so.
> use an altered MAGIC.RAM file from a CT2B system?

No
Yes I can! But whether it thinks it's running version
6.20 is another matter! I shall have to try the
keyfile program. It refused to work with a CT2B, even
though I used a VFAT partition.

I shall battle on.....

Regards

Neil :-)

>I have searched on the Web for printer drivers for my 1040 ST and have had no
>luck. Could someone please tell me where I might find ST printer drivers on
>the Web? Thank you.

Tad - Generally there is no such thing as a generic printer driver on the Atari: Most programs need their own. But if the program can operate under GDOS, then you can buy NVDI which incorporates drivers for many printers (except the latest PC-only ones). Note that this only gives graphics printing - i.e. the page is output and printed as a bitmap image. Slower than printing text from word processors etc. using the printer's built-in fonts, but allows use of various fonts and sizes in one document with suitable programs.

For printing text only, there is also the Shareware IdeaList, which comes with many drivers and gives very flexible control of the print output in a variety of fonts, sizes and columns, though you can only use one font per document (though attributes like bold, italic, underlined etc. are possible). Works with and without NVDI/GDOS. You can contact the author on: bartholme@t-online.de

Source record: 36940

It is probably not the disk, more likely that fact that PCs are notorious for not being able to use more than 79 tracks. Can you not try it on a proper ST and use a program such as FCOPY to see if it is the disk.

FCOPY can also help repair bad sectors and tracks, however if it is a game then there may well be a copy protection hidden in these tracks, repairing them will render the game useless.

If it is simply a data disk and the sectors are bad then the data is most likely gone.

Elliot...

I'm usually late to reply, but there are short English docs to this
program:

```
-----
The program code of the multitasking operating system MagiC is not
located in a ROM area like TOS but in RAM. The RAM contents can be
changed by any program. Buggy programs might destroy parts of the
MagiC code which can lead to a system crash.
MAGTOROM runs on Ataris with MC68030 and ensures that the code of
MagiC cannot be changed. For this purpose MAGTOROM programs the 68030
PMMU. After installing MAGTOROM a write access to the MagiC program
code results in a bus error like writing to the TOS ROMs gives a bus
error as well. You get the best protection if you place MAGTOROM in
the AUTO folder right after the MagiC booter. MAGTOROM can only
protect the complete MagiC code if you use the program MAGXBO32 as
booter. When booting with MAGXBOOT only a part of MagiC is protected.
MAGXBO32 belongs to the MagiC distribution.
As MAGTOROM does not leave any code in memory there should not be any
incompatibilities with programs not using the 68030 PMMU. When using
the virtual memory manager OUTSIDE, MAGTOROM is not needed because
OUTSIDE automatically protects the MagiC code the same way MAGTOROM
does.
MAGTOROM cannot be used together with SCSI.RAM by Steffen Engel. Use
SCSIDRV.PRG instead.

MAGTOROM is Freeware, it may be copied as long as this text is included.

2240. Atari SC1224 monitor on Amiga 2000?

Newsgroup: comp.sys.atari.st
Date: 2002-03-14 01:46:22 UTC
From: sluna2@earthlink.net
Message-ID: <3C900178.7030804@earthlink.net>
Source record: 36942
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,comp.sys.amiga.graphics,comp.sys.amiga.misc

I have come into the possession of an Atari SC1224 color monitor.
Being fresh out of Commodore 1084 monitors (they've all died), I was
wondering if it was possible to connect the Atari monitor to my Amiga?

I did a little web digging and got some pinouts. Here's what I
figured out, but I am not sure how correct this is:

Atari ST video connector (13 pin DIN): Amiga RGB connector (D-23):

1 AO Audio Out ------------------
2 CVIDEO Composite Video ------------
3 CS Clock Select ---------------
4 MD Monochrome Detect/Clock In - 15 c1* (clock out)
5 AI Audio In -------------------
6 G Green ---------------------- 4 green (analog green)
7 R Red ------------------------ 3 red (analog red)
8 +12V +12 VDC (520ST has GND) ---- 22 +12v (+12 volts power)
9 HSYNC Horizontal Sync ------------ 11 hsync* (horizontal sync)
10 B Blue ---------------------- 5 blue (analog blue)
11 MVIDEO Monochrome Video -----------
12 VSYNC Vertical Sync -------------- 12 vsync* (vertical sync)
13 GND Ground ---------------------- 16-20 gnd (ground)

Another source I got off the web says that pin 8 is audio ground,
so I'm not even sure if I should bother connecting this pin. I'm also
not at all sure about the clock lines. Also, were the RGB lines for
the Atari analog or digital? Any insight would be appreciated. Thanks!

Sinplop!
As far as any issues within this newsgroup are concerned, or the Atari community in general, your postings and presence are insignificant. Please don't make it sound like there is support of any kind for your presence here by any other member of Usenet. I only reply to your post so I can keep practice up on spelling "Dick Head" correctly.
However, next time you make a convention in the Southern California area, please let me know so I can have a shot at kicking your ass. Not all geeks are mild mannered. Some are psychopaths.
Your friend,
Michael

2243. Falcon help PLEASE

Newsgroup: comp.sys.atari.st
Date: 2002-03-14 06:18:53 UTC
From: Mark Duckworth <mduckworth@anti-spam.atari-source.com>
Message-ID: <u90gbvoea93dab@corp.supernews.com>
Source record: 36945
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I apologize ahead of time for this absurdly long post.

Hello all,

After doing a bit of research and IRCing, I decided to come here for a bit more help. My C-Lab Falcon MK-2 with standard atari 14 meg ram board, scsi and ide drives, etc. Has been having odd symptoms since the day I bought it. The symptoms?

1) Earlier version of Groumf Tracker worked fine, latest version will play fine but gives a messed up display. Seems like a programming issue but I am the only one to report this phenomena. Also will display artifacts like something is writing to video memory!

2) under MagiC, TOS, and MiNT, Aniplay while playing mp2 or mp3 (DSP) will get a crackling in the left speaker. Changing some settings can get the crackle to be in the right speaker. Originally I thought turning off DMA transfers would stop it but it doesn't. I also thought Nocrew's mp2 player did not produce crackling but it does too! Even FalcAMP does. Falcamp behaves oddly under MagiC. When I move the mouse fast or do other things, the mp3 playback will actually slow.

3) MagiC runs perfectly... I know right? It's a falcon that runs MagiC fine... but MiNT on the other hand has all sorts of problems. XaAES crashes 5 minutes after starting.. keystrokes are stolen between vconsoles. N.Aes doesn't work much at all and refuses to start in 256 color mode. I have done identical setups under aranym as my falcon. I am not crazy or setting soemthing up wrong, aranym works perfectly, my falcon doesn't. Also under N.Aes tos2win crashes with a bus error when trying to run bash, whereas under Xaaes it will run but will be deathly slow to do anything.

The diagnosis? Well some have suggested bad ram in the DSP, others have suggested bad DMA fix. Taking the DSP problem into mind, it's worth noting that the earlier version of Groumf tracker works PERFECTLY and has never crashed, ALL DEMOS I HAVE EVER TRIED including Hmm have worked perfectly. DSP jpeg decoder works perfectly. DSP effects like echo and reverb work perfectly. AVR playback works perfectly, everything is fine except fscking mp2/mp3 playback. I haev gone over the mp2/mp3's with a fine tooth comb too.. they are good encodings.. they play perfectly on any other machine.

The DMA fix? Well referencing this DMA fix:
http://atari.nvg.org/cpu_accel/

I have found that mine differs severely. The other two resistors near R221 are removed, legs 13 and 12 are not jumpered together. The trace of R216 is NOT cut on mine, and the resistor is gone! The IC that is piggy backed

is the right chip and in fact the only identical connection seems to be power and ground.... hrmmf..... maybe clab borked it?

I really care about my falcy and I'd love to be able to use the DSP to it's full potential to decode mp2's at 0% cpu usage, but the evil crackling on bass hits is horrible....

The last thign I must note is that the output gain of the mp2 and mp3 players seems significantly higher than that of groumf tracker and all of the demos which work fine. This audio crackling could be some internal DSP gain setting which is set way high (for mine to handle).

Anyone have any ideas.. should I redo my dma fix to match the one listed and replace the piggy backed IC which appears to have green stuff all over it? (not copper oxidation).. Perhaps wait for the CT60 which might somehow magically fix any and all of my problems? ;)

Any help would be much appreciated!

Thanks
Mark

> solution.

Note that this will not change anything with respect to SCSI
performance. With respect to Falcon SCSI the problems are always the
same, with or without CT2b: A lot of Falcon need a clockpatch because
SCSI/DMA does not work properly and even a clockpatch does not always
help. There is no way to fix this with software.

I dont know about items 1 or 3, however someone else reported crackling speakers and I suspect that your problem is the same as thiers, its your speakers that are not up to the job not the Falcon.
Solution - buy better speakers (20Hz-22KHz).

Stephen Moss

> TOS 4.04 allows to have 2GB partitions

I tried that but several people warned me. I once lost the contents
of a whole partition when I tried to copy a file to it and there
wasn't enough space on the partition but I can't say whether that
has been caused by cecile (which I then used), by a problem caused
by the 2 GB, or something else.
Fact seems to be that TOS 4 seems to be specified for 1 GB but allows
2 GB and most, but not all, GEMDOS commands work okay with 2 GB
partitions. So since I don't know what caused the data loss then,
I'm rather cautious now also I would like to use 2 GB partitions again.

There is a bug in TOS 4.01 (I do not know other versions, but in 4.04 it was
fixed) causing that if you tried to write something to partition, and there
was not enough space, rest of data was written at the begining of the very
next partition totally messing it up (overwriting FAT for example).

I belixe that fixes for it (as PRG for AUTOfolder) exist on the net
somwhere, just search the ftp servers.

I have MagiCMac, too.
For Next time, I will use aranym on an Intel/AMD-PC and I hope that ASH
will support aranym, perhaps with a distribution for their own.

regards, Ludwig

> did not produce crackling but it does too! Even FalcAMP does.

Probably a SDMA problem. Try to replay some mp3 (128kbps or more) with
Aniplayer, enable DMA tranfers and listen. If you notice any strange sounds,
as strange sythetic "birdsing", then you need a new clock-patch.

BTW, I designed a clock-pach which is suitable for any Falcon with or
without acceleration (probably except CT2 or AB040). As a starting point I
used the Nemesis clock-pach (I used this circuit also in my Phantom
accelerator), which 100% fixes all SDMA problems, but you need the right
SN7404(N) IC. It means you must test each IC manually, even they are
all from the same manufacturer !!! In other case your Falcon will be less
stable especially when it runs Cubase or other MIDI software. The wrong IC
causes only incompatibility, not any DMA problems.

So in my clock-patch I use the SN7404 (from Texas Instruments) only for SDMA
and 74F04 for the rest signals. It works perfectly in my machine, even it's
overclocked from 32/16 to 50/25Mhz.

>Is the conclusion as follows?:

HSModem also allows remapping of lower baud rates to higher ones for those older comms programs that only go to 19200 or so (assuming that there's a hardware mod such as the RSVE or whatever) such as the terminal for CiX. In my case, a setting of 150 equates to 115200, otherwise it allows a max of 38400 only.

The Systran online translator on the Internet is the best choice really,
although it doesn't interface that well with an Atari. Best bet is to chuck
your text file onto a web page and point it at that.

Print out the screen? Do you mean "do a screen dump"? The Atari routine
only works with pin printers.

The Canon printer *may* be one that relies on the computer to do the work
of rasterizing.

Thanks for the info. I have 4.04 installed too. So the problem must
have been something else. Would be interresting to hear about the
experiences of people who use 2 GB partitions.
BTW, do you use BIGDOS ? Wouldn't that be a possibility to get more
partitions. I tried to install it once but there were some problems
I can't remember now and I removed it. But maybe that was the time
when my Falcon was unreliable as a whole before Rodolphe repaired it.

Bigdos supports (IIRC) up to 32 partitions, but it does not support
partitions bigger then 1GB.

If you ask me, FreeMiNT is best sollution. Why? take lots of small files
(for example: High Voltage Sid Collection, more then 18000 files with sizes
about 5kb) and on 2GB FAT partition every file will be at least 32kb big
(due to a cluster size, and whole collection will take 596.000kb (yes! over
0.5GB!). The very same files on my ext2 partition took only 100MB (YES! 5
times less! the same files!). This is becouse on ext2 partitions block size
ccan be always 512 byte :)

now watch - I think you'll be getting an e-mail from your ISP saying
that sinclap claimed you "Threatened His Life". It did that one other
time when it was claiming that the US had better health care than the
UK, and one UK user jokingly requested sinclap come to the UK so he
could break its legs so it could see firsthand how the UK health system
actually worked.

not only is sinclap a drooling mumbling crank, but he also has No
Sense Of Humour. And he's also too chicken to post to the Mac
newsgroups, seeing the moment he made one of his usual idiotic postings
the denizens there would reduce him to onion rings in seconds :)

But at least I would end up with up to 30 GB HD + CD-R + CD-RW
So the question is only how reliable Bigdos is and if there is a
certain version I should use.

On the other hand when I want to use AudioMaster to produce a CD I need
TOS and with maybe a dozen files to fill a 1 GB partition the few
wasted kb don't really matter.

it would be fine if fVDI processes config-files for programs that run
only in a certain resolution and color depth and switch to this
resolution if such a program starts or comes to the fore. The Overscan
software for the old ST's made this, even together with MultiGEM.

ext2 is faster than fat, and morover it allows to use long filenames. Also
under FreeMiNT you can easily acces FAT32 partitions and minix partitions
(minix is a bit outdated, but Linus Torvalds still uses it :) )

Stephen,

Unfortunately,

that cannot be the case. My Falcon has been tested using Harmon Kardon speakers, my Denon stereo system a pair of sony studio quality headphones, a set of cambridge soundworks speakers. Tons of speakers that work fine for anything and everything don't work for my falcon. I definately the think the falcon is suspect.

Btw. it has been asked some time ago / by me :) / whether Aranym would
work with the ill-fated TOS4.92 (the one having the multitasking AES)
and the answer was that it should work. However, to answer my own
question differently: Aranym does not work with TOS4.92 (complains about
image size, etc. because this TOS image is, for some reason, slightly smaller
than TOS4.04 image). This has been tried on the Windows version of Aranym.

I am aware that using TOS4.92 (i.e. AES4.1) + Mint would not be the best
solution; I just wanted to try a simple all-in-one setup, without the
need to acquire and load a separate AES.

BBtw. I had trouble running Selectric file selector in Aranym. has this
been experienced by someone else, too?

I would appreciate some info on the "comming mini Linux" for Aranym
which has been mentioned here... is this a minimum set of Linux to be used
just to launch Aranym? What are the chances of Aranym developers
preparing a kit for complete installation and configuration of Aranym
and underlying OS for instant creation of a "SoftAtari" on a clean PC?

Should work nicely, except for having to come up with 2 of the most difficult plugs to find in the world. Not trying to be an asshole, but unless you've got existing cables to chop, it's just not gonna be possible.

I tried to replace that one with an F rated one on the clock patch
expecting it to work better. Infact, it did do that warbling sound
and the computer was worse. It's really an odd problem, does anyone
know what exactly is needed for the DMA to work properly, is it a
clock signal with longish rise/fall times, or delayed by so many
nanoseconds from the bus/cpu clock? I have something from ST Computer
from Chips and Chips but the last couple of pages where I feel the
author explains it all I can not understand, it's German and I don't
have any techincal German dictionaries.

Thanks.

Mark, might sound like a bad clock to the DMA, or even DSP?

You can't. There is no ext2 driver for MagiC, the only TOS-compatible OS
that can access these partitions is FreeMiNT.

> Which fs drivers for MetaDOS are available, if not ext2?

Mostly drivers for CD-ROM filesystems, as this is what MetaDOS was
designed for.

When I first got an STe and was beta-testing Timeworks 2 I found this program really suffered badly from this - not with scrolling two lines instead of one, but when clicking on the dark part of the window slider it would move two pages instead of one. Being a GDOS program that didn't like NVDI I was looking at some horrible delays for redrawing the screen. Very annoying...

From the GemRam docs:

GEMRAM identifies GEM by the length of the GEM-TEXT-Segment.
GEM Versions of foreign/unknown countries are accepted if the
length is identical.

> Yes, it looks impressive to be able to move windows and sliders in

It's for feature enhancement, not for system speed-up - the eternal trade-off. We've been spoilt when Magic came out and speeded up the system as well as adding extra features...

IIRC System Solutions\Atari Workshop released a TOS loader program for use with MagicPC so you could make TOS 2.06 available for it? Perhaps search their site?

Note: my memory may have completely failed me here - I can't see why you'd need TOS for MagicPC, but there you are...

I got these from the section under TOS. Some relate to TOS 3.0x rather than 2.0x, but I believe they were being developed at the same time so probably relate to both.

Hallvard,

You could always offer a reader maintained links page where if someone
finds an outdated link, they could change it automatically. It might
be subject to abuse but I think the benefits would outweigh the risks
in our case.

Hrmm,

I don't know. I know the piggybacked IC on mine is a 74F04. I am interested though to try this SN7404 + 74F04 method. Perhaps it will work better. I don't have any warbly sound though, in fact the reproduction sounds flawless aside from crackles at high spots (drum hits etc). The beginnings and ends of songs where it is fairly quiet tend to produce no crackles. Sounds like maybe I have some other problem?

Thanks

Funny you should bring that up, because I do indeed have some
spare connectors of the proper type; a few spare Amiga RGB cables for
different model Amiga monitors, and a monitor switcher for Atari ST's,
to allow for a monochrome and color monitor to be plugged into one ST.
I ought to be able to disassemble both of these.

2280. Help w/GeSoft Mighty Mic 32 TT-Ram Board

Newsgroup: comp.sys.atari.st
Date: 2002-03-15 07:44:41 UTC
From: John Perez <jhperez@uhunix1.its.hawaii.edu>
Message-ID: <a6s8p9qsp1@news.hawaii.edu>
Source record: 36981

Greetings,

I've finally got some time and room, and that means getting out the Atari computer inventory to put together some whole systems. In one of the TTs that I purchased, there is a TT-Ram board called a GeSoft Mighty Mic 32 B. It has 8 30-pin simm slots, and three, three position jumper blocks as such:

...J0
...J1
...J2
123

I would appreciate any help that anyone may be able to provide with regard to what the jumpers may signify, and what sort of ram to populate this board with.

Thanks,

John Perez

>only works with pin printers.

Yes I do mean a Screen Dump using the "Print Screen" selection from the
option menu.
I know the Atari routine was written to work with pin printers as ink/bubble
jet was unavailable at the time, however it does still work with some older
ink/bubble jet printers.

>The Canon printer *may* be one that relies on the computer to do the work
>of rasterizing.

This may well be the case, the point in testing them was to try and prove a
theory that modern software driven only (no dip switches to change settings)
printers are not able to print correctly from TOS.
Although as I also stated eariler this will be accademic in a couple of
years time unless someone can produce a Serial port to USB interface as we
will not be able to connect to a printer let alone print from it.

Source record: 36983

Hey guys,

Just to follow up this is what I've found. Mp2/3 playback is in fact FINE on all software EXCEPT aniplayer. So what we have is aniplayer crackling with mp2/3 only, but only under "DMA DSP transfers". the Mp2 player from nocrew is in fact crystal clear and the one encoding I tried with it is what was crap :) FalcAMP also works fine under MagiC now that I recall but instead will eventually get screwed up (but only if I try to multitask), which is acceptable as it isn't a hardware issue ;)

So now it's just software incompatibilities like GTK and GemGT2 plus aniplayer crackling. Any ideas? Should I use an oscilloscope to test clock to DSP or is there an easier method? I have a decent tektronix oscilloscope but it's a state away.

Thanks for all your help!
Mark

That's wrong. It's documented only for 1 GB and there are AFAIK some bugs
that can cause data loss if you really use such big partitions under TOS
4.04.

Emulators.

I am fascinated by how much I don't know about emulators - I initially said that Gemulator was the best for emulating my Atari, which is a 4M STFM, on a Windows machine. I would prefer to use SuSE Linux which I have installed but had not heard of Aranym for Linux -will it work for my Atari? If so where do I get it?

Thanks for all the info

It seems like a distortion on the analog side rather than a SDMA problem.
Are the creckles still present when you lower the volume (volume are "+" and
"-" keys) in Aniplayer ?

> smaller than TOS4.04 image).

That's OK. Aranym checks if the image is TOS4.04, so you cannot use other
TOS *instead* a primary TOS. You still can use it inside Aranym same way as
on real Falcon, though.
BTW, don't know very much about TOS4.92. Is it a complete standalone TOS ?
Is it 68040 friendly ? Can it be ditributed freely ? Is it fully usable ?
If the answers for all these questions are "yes", we should support it as a
primary TOS image.

> I would appreciate some info on the "comming mini Linux" for Aranym
> which has been mentioned here... is this a minimum set of Linux to be used
> just to launch Aranym?

Yes. The whole "minilinux" should be fitted onto one or two floppies.

> What are the chances of Aranym developers
> preparing a kit for complete installation and configuration of Aranym
> and underlying OS for instant creation of a "SoftAtari" on a clean PC?

The chance is very big, because this is the main goal of the whole Aranym
project.
However, we have to do more important things first.
There is still no serial/ethernet/sound/JIT/native interface/etc..
These things must be done before the first real relase.

> So now it's just software incompatibilities like GTK and GemGT2 plus
> aniplayer crackling. Any ideas? Should I use an oscilloscope to test
> clock to DSP or is there an easier method?

There is nothing you can test via oscilloscope. The main point is if the problem is in SDMA or elsewhere.
You should test you SDMA first, because it is the simplest way:

1. Go into plain TOS (+NVDI if you can) without any ACC, CPX
2. Switch into highest resolution and color depth you can.
3. If Aniplayer + mp3 + DMA tranfers = strange sounds on higher frequencies (similar when you play a damaged mp3 streams), then it is most probably a buggy SDMA
4. Copy a big ZIP file onto floppy, then copy it back a open it. If the file is damaged be 100% sure your SDMA is buggy.

Anyway, if you have an unaccelerated F030 with *any* clock-patch, your SDMA should be OK.

> You can't. There is no ext2 driver for MagiC, the only TOS-compatible OS
> that can access these partitions is FreeMiNT.
That means it is impossible to access ext2- or minix partitions without
MinT? Isn't possible with plain TOS only?
For me the problem with MinT is that PurePascal and perhaps some other
programs don't run with it.

Citrad,
yes they are still there even when I lower the volume. I would think that
this could perhaps be an analog problem but I notice under aniplay I will
get crackling even during silent parts of some mp2's.

>�which would keep the CPU on 16MHz while ACCESSING THE ROMS
>
>Very interesting !
>What to do to run the roms faster ?
>Can it be done on eproms too ?

I think that 120ns EPROMs are just barely fast enough to stand it,
assuming that the CPU latches the data at the end of the second cycle
after address strobe (I don't have the timing tables for MC68k handy).

IF the ROMs are fast enough, one has to generate the correct ROM-select
signal. On a ST, there are -ROM0, -ROM1 and -ROM2 signals which are asserted
when accessing the ROMs. They should be added in an AND gate or something
like that so that a single "rom select" signal is generated- in a MegaST
this AND gate already exists in chip U12.

If one does not use the on-board (EP)ROMs but an additional circuit,
such as that for TOS2.06 EPROMs, then the "rom select" has to be
generated in some similar, convenient way.

Now, all versions of the basic CPU accelerator consist of three parts:
1) clock select logic, 2) D-flipflop for executing clock-switching
only at proper moments, and 3) 2:1 clocks multiplexer. The clock
select logic decides when to switch from 8MHz to 16MHz and vice-versa.
Basically- if address strobe is active (meaning that a bus access is
in progress) the clock is switched to 8MHz. This part has to be designed
differently, so that if "rom select" signal is active, the clock stays
at 16MHz during the bus access.

One would have to make the complete circuit as simple as possible in
order to reduce propagation delays to a minimum (74F** chis are mandatory,
74LS** won't do), and one has to take care of the relative timings when
designing the circuit. I have experimented with such a circuit and it worked
but I did not finish it properly, because of the lack of time- in
order for -any- accelerator to work reliably in a ST, it is very advisable
to replace four on-board chips (2x 74LS244 and 2x 74LS375) with much
faster 74F*** variants- which is a rather delicate job because the chips
are not socketed. I replaced those chips but didn't have the time to
reinstall the prototype accelerator, and I had an additional complication
in the presence of the Blitter chip in my Mega, etc, etc,... but I plan to
experiment with that some time soon.

BUT- I discussed this circuit with Lyndon Amsdon and then he made a similar
one- which worked reliably for him in a ST (the speed gains I quoted are

from Lyndon). Instead of EPROMs he used static RAM chips (I think they have about 60ns access time) and our idea was to make them battery backed so that one could load TOS into the SRAMs and it would remain there (precautions have to be taken, so that one can boot with the old TOS if needed). In fact, using these SRAMs and after replacing the '244 and '375 chips, he was able to run the -complete- ST on 16MHz! Unfortunately, by prolonged over-zealous miscellaneous experimenting he finally fried that computer :(

Yes- for other TOS versions the relocation information is different,
e.g. to quote from the command file for the same utility and a British
TOS:

:but watch out for address differences between German and UK Roms:
; "in the German TOS there is a routine to handle the extra
; German keys at 323A..3293 inclusive, 5A bytes long. So
; any patch above this area has to be at address 5A lower
; in the UK ROMs". Darryl Piper

; "but there are other misregistration(s) e.g. the 8x16 font
; is at 33F32 in the UK TOS, but at 33F62 in the German TOS,
; a difference of 30". Philip Taylor

But, as TOSPATCH have provisions for replacing the .RSC files of
TOS, as well as fonts, I suppose that one can start from a German
version and make it into whatever one wishes. I have thus translated
the RSCs and now have a completely English German TOS 2.06 :). I even
changed the "nationality" signature so that the few programs which
check this think it is the British TOS- and I did not notice that
it made any trouble. And I have the bonus of additional keys
routines (nonexistent in a real British TOS) - not that they are
of any use to me :)

>> Alternatively, instead of RELOC206.FIL you may use another of the control
>> files supplied with TOSPATCH, e.g. the largest one (F206_REL.FIL) and
>> activate many other patches, such as SHELLBUF or WINX features
> [....]
>I understand. So the different *.FIL files each have one specific area
>of patching the ROMs?

Well, one of the *.FIL files supplied with TOSPATCH is just for relocating,
another is a large file containing a considerable number of possible patches,
and the others are for splitting TOS into 2, 4 or 6 EPROM-image files.

>Can you for example run the TOS image through one
>patch, then run the modified TOS image through another until you've
>gotten all the patches you want?

I suppose that this should work (I didn't try to patch the same file
several times in a sequence) but you would have to prepare suitable
*.FIL files. For us who are not very wise in this matter it would be probably
sufficient just to activate or deactivate the desired patches in that
large all-in-one supplied .FIL file- the syntax is such that one just has to
mark one flag for each patch so it is rather simple.

In fact, I would call all that stuff more a -customization- than patching.
For example, one can remove memory-checking at boottime, or remove
grow/shrinkboxes when opening/closing windows (this has an amazing positive
effect on the liveliness of the desktop).

>I guess the final thing to do is burn the TOS image into an EPROM chip
>(after having tested it with the RAM loader of course.

Yes. Or else, a hardware-hacking prone mind might install a set of
battery-backed static RAMs (SRAMs are practically pin-compatible, about
25% more expensive and 100% faster than EPROMs) so that one can experiment
with "ROM based" different TOS versions ad infinitum- or put Magic in them...
but take care to keep the real ROMs switchable as well, so that one can boot
the computer if the SRAMs content gets corrupted...

>> One has been made by Pera Putnik,
>[...]
>It's still there, and it's called "SelTOS".

If it can't find TOS image, maybe you should check whether it looks
for it in the AUTO folder or in the root directory (more likely, IMO).

> IIRC System Solutions\Atari Workshop released a TOS loader program for
> use with MagicPC so you could make TOS 2.06 available for it?

You donï¿½t need any TOS loader program for MagiC PC.

If You want to run MagiC PC with any single TOS You just have to replace the file "Magic_PC.os". If You name any TOS Image as MagiC_PC.os the emulator will run this in place of the MagiC OS.

The MagiC PC compiler donï¿½t work with Single TOS. Also MagiC PC with Single TOS canï¿½t write on windows-drives. So You only can use the container drives.

Correct, you need MiNT to access these partitions. But why not use FAT32
partitions instead? Both MagiC and MiNT will access these.

> For me the problem with MinT is that PurePascal and perhaps some other
> programs don't run with it.

What's the problem with Pure Pascal? I don't have it myself and have never
tested it with MiNT.

Steve,

Just so there's no confusion the audio equipment hooked to the falcon consists of Paradigm Titan version 2 speakers with 60Hz - 20Khz frequency response, a Denon AVR-75 receiver while I can't do the extreme lows (20-60Hz) I think my audio equipment is quite satisfactory.. and no I'm not a vynil buff. I don't know what crack whoever is on who wants to make fun of me but audiophiles everywhere give high marks to the Denon AVR-75 and EXTREMELY high marks to the paradigm titans.

Mark

Ctirad,

I tested the SDMA using the floppy method. Works perfectly, the large zip is not corrupt. What's weirder? I just figured out how to fix it thanks to some suggestions by Didier himself. In aniplay 2.19, I load up an mp3 and begin playback. The crackling exists. If I select "Good quality mp3" the crackling stops. At this point if I close the mp3 and start playing mp2's whatever state selecting that option left the DSP in or whatnot solves playback problems for mp2 playback ALSO. Regardless of what is going on with aniplay or my falcon, I have a smile on my face and am listening to music crystal clear on my falcon under aniplay. We''ll see just how good my clock patch is though once the CT60 arrives ;)

Thanks for all of your help guys, I guess this is between me and Didier now.

Best Regards,
Mark

Hello everybody,

I heard that some SIMMs ram are 'byte wide' and some other arn't ?

What's that ?
It was not so easy to recognise EDO from FPM, but how to recognise 'byte wide' ones ?

Regards

Well, you could check your local 2nd hand shops, most of them have old pc's
towers, I've got two towers sitting here that where thrown away.

I have it. I have my TT in a Lighthouse Tower case, and keep also the
original TT case, I can give you one of the two, the problem is I am in Italy.

I have to say that I doubted the original statement that it was possible
to print an ASCII listing of a window via this method though!

>I didn't pay too much attention to how the graphic printout looked like,

>do it quite right. But at least it didn't print a load of garbage.

The thought came through my mind that there might be some sort of 9 pin
emulator in the printer, but I'm probably talking rubbish as usual!

I suspect that the BJ-10ex was switched to Epson emulation mode,
which is why it printed graphics from the desktop. But as you say
it's likely to give smaller images due to the higher print
resolution.

: Being fresh out of Commodore 1084 monitors (they've all died), I was
: wondering if it was possible to connect the Atari monitor to my Amiga?

: I did a little web digging and got some pinouts. Here's what I
: figured out, but I am not sure how correct this is:

: Atari ST video connector (13 pin DIN): Amiga RGB connector (D-23):

: 1 AO Audio Out ------------------

This is where you connect your Amiga stereo leads.

: 2 CVIDEO Composite Video ------------

The Amiga 2000 (possibly not the C or D models) has only got monochrome
composite video, unless you use an RF modulator. Leave this pin be.

: 3 CS Clock Select ---------------

Leave be.

: 4 MD Monochrome Detect/Clock In - 15 c1* (clock out)

Leave mono detect be. An Atari mono monitor will ground that pin, but it
is useless in our case, and probably not even connected. Also, leave the
clock signals be, they're for genlocks and other special requirements.

: 5 AI Audio In -------------------

Leave be.

: 6 G Green ---------------------- 4 green (analog green)
: 7 R Red ------------------------ 3 red (analog red)

Right.

: 8 +12V +12 VDC (520ST has GND) ---- 22 +12v (+12 volts power)

Not sure what this is for.

: 9 HSYNC Horizontal Sync ------------ 11 hsync* (horizontal sync)
: 10 B Blue ---------------------- 5 blue (analog blue)

Right.

: 11 MVIDEO Monochrome Video -----------

Not relevant for the SC1224.

: 12 VSYNC Vertical Sync ---------- 12 vsync* (vertical sync)

Right.

: 13 GND Ground ---------- 16-20 gnd (ground)

Aren't there several kinds of ground on the Amiga video connector?
Someone?

: Another source I got off the web says that pin 8 is audio ground,
: so I'm not even sure if I should bother connecting this pin. I'm also
: not at all sure about the clock lines. Also, were the RGB lines for
: the Atari analog or digital?

The Atari monitors were analogue.

I am using Ghost link at present (I have it working under Win2K), you can map your PCs drives to your ST. It is stable and can reconnect at any point.

I have tried Parcp and it looks good and much quicker, however one does need to make a new cable.

There is also Para2000 but I have never managed to find it, I would hope it could use a standard Laplink cable which would make things easier.

I was wondering, since the sync lines on the Amiga RGB pinout diagram had an asterisk by them if I did not need to run those lines through an inverter before I sent them to the Atari monitor?

> : 13 GND Ground ---------------------- 16-20 gnd (ground)
>
> Aren't there several kinds of ground on the Amiga video connector?
> Someone?

The Amiga RGB port pinout diagram I have does note a ground return line for the clock signal on pin 13. Otherwise, lines 16 through 20 are simply labeled 'ground'.

Also, I guess there would be no point in connecting the +12 volt line. Unless the Atari monitor required it for something? I wouldn't know what.

I did not think any SIMMS were "byte wide".

32 pin simms are 16 bits wide,(2 bytes)
72 pin simms are 32 bits wide.(4 bytes)
DIMMS are 72 bits wide.

And as far as I know all allow a single byte to be written.
```

I think the reason you need a special cable is that the ST printer port is
such a
minimal implementation (i.e. many signals on a PC port are not available on
the ST),
LAPLink cables are useless. And I see the latest version
of ParCP will work under NT/2K, must download and try it.

Hi Ctirad,

Not really, you know it's not easy to play all mp3 with a DSP at 32 MHz,
especially joint-stereo 44,1KHz. When quality is removed, there are lot
of tests for reduce DSP load (you can see the load of each CPU with
CTRL-I after playing). Now, sorry for some technical words...

There are 2 instructions for run loops inside the DSP chip:
- The 'do' instruction who uses the stack, is a true loop.
- The 'rep' instruction repeat the next instruction, this 'rep' cannot
be interrupted, so it's possible than out samples from DSP are dalayed
or forgotten.

This famous instruction 'rep' is used when Quality is removed.
This subroutine is also uded for MP2.
When 'DMA->DSP tranfers' is used it's the DSP who send samples to
output, otherwise it's the 68030 who take samples from host port and
send the result to DMA sound chip. So it's normal that the sound is good
without 'DMA->DSP transfers'.
For resolve the problem, you can set the 'Quality mp3' during playing
and save the config. But it's possible in this conditions (a DSP at
32MHz) than some files are played in mono, there are a test of DSP load
inside the DSP MP3 program.

> the "good quality mode".....

The 'quality mp3' option is separated of 'quality' option since V2.15,
this line appears in the menu when the file is played.

Regards,

Didier.

```
The 30 pin simms used in STEs and older PCs are byte-wide.
That is why they are used in pairs on STEs.
PCs required 9 bit-wide for parity checking.

> 32 pin simms are 16 bits wide,(2 bytes)

Never seen those.

The problem wasn't the maximum number of open windows. This was limited -
but harmless. There was a bug that caused strange problems when you had
too many folders on your (hard)disk. I don't remember how many. With
FOLDRxxx you could increase that number. AFAIK the bug was supposed to be
fixed after TOS 1.04, but wasn't completely. I never quite understood if
the bug was or wasn't fixed after that. Anyone ?

You don't need FOLDRxxx if you use HDDRIVER, which has a similar bugfix
built in.

Can anyone give me a short introduction on SLB (Shared Library) files ?
I found some when I downloaded Aniplayer but have no idea what they do,
how to install, and how to use them. I have understood it was originally
something for Magic, that also works with newer MiNT versions. I use MiNT.

From: Thomas Jordan <Thomas@thomasrichard.freeserve.co.uk>
Message-ID: <a72iep$jv0$1@newsg4.svr.pol.co.uk>
Source record: 36895

Any advice on the following.

After converting resource files with Icon Extract the files are viewed in
resource master.

When viewed in resource master the files are displayed in 4 bit plane, after
selecting a individual icon that icon is then opened up in 1 bit plane.
The 8 bit resolution has to be then selected to view the icon so that the
palette is not corrupt.

The palette does not corrupt if the icon file is viewed in another resource
viewer eg RSCView " from Phillip Donze http://home.tiscalinet.ch/donze

That is VERY easy to do, simply put a stright flat cable with two db25
connectors crimped, just crossing STROBE with BUSY, I made one such cable
years ago with a switch to cross/uncross STROBE and BUSY with three
connectors, so I was able to leave two computers and one printer connected
and print from both and transfer files without moving cables.

You may have seen my own MikeNet, but it can only link two STs at a time and
does not work with magic or MiNT (at least I thing so).
It was really I nice program to share drives at MIDI speed, transparent to
TOS and you could redirect any drive letter to another, local or remote.

I think if you use the URL without the http:// prefix CAB automatically
adds http://www. to the entry.

Not quite right. It wasn't the number of folders on the hard disk,
but the number that you opened. ISTR that TOS didn't release
buffer memory properly, which is why the problem arose if you
opened more than 40 folders. Also the Malloc() function had a
similar limit in TOS 1.0 and 1.2; fixed in 1.4, though as you say
this introduced another bug (which was overcome by POOLFIX3.PRG).

There is a long description of this under 'Forty folder bug' in
Mark Baines' /The Atari A to Z/.

BTW, not just HDDRIVER fixed this - ICD Utils also had a method of
setting a higher number of folders. Not sure about AHDI - think
not.

northstar2010@_I-hate-spam_yahoo.no said:

>Anyone?

Hi Halvard!

Sure!!!

TOS 2.06/3.06

VDI-FIX 1.10 by Karsten Isakovic: In all TOS versions apart from
1.02, 3.06 and the KAOSes there is an error in the VDI that can
lead to wrong handles being returned with 'v_opnwk' and
'v_opnvwk'. This error is due to incorrect management of the
internal list of VDI workstations if workstations are repeatedly
opened and closed. This can lead to faulty graphics display and
crashes.

ARROWFIX 1.5: Arrowfix tackles several AES errors in GEM 3.2 of TOS
2.06/3.06, namely the scrolling errors with the two WM_ARROWED
messages; in addition with some messages a wrong value is entered
for the over-length of a message, and furthermore when clicking on
an ARROW element in some circumstances in Accessories a wrong
method is used for sending the message. Due to this the execution
of an event only occurs after a delay (e.g. ST-GUIDE).
However for its work Arrowfix requires a GEM to be in RAM. In
order to get the TOS from ROM into RAM, an additional program is
required: For instance GEMRAM by Martin Osieka, or ROMRAM by
Alexander Herzlinger on the TT. These programs copy the TOS or GEM
from ROM into RAM and see to it that they are executed from there.
Naturally this costs some memory space, but with ROMRAM it also
gives a speed increase as the TOS is copied into FASTRAM from
which it executes faster.

FLOP-FIX by Harun Scheutzow: Flop-Fix remedies problems in the
floppy disk management of TOS 2.06/3.06/4.0x. These problems
concern the recognition of disk changes when using two disk
drives, and allow correct access to floppies with only one FAT. For
this the complete Getbpb Bios routine is replaced, Also an error
is remedied that can lead to the VDI font information being
destroyed. This can occur because the floppy routines and the VDI use
the same temporary buffer. In addition Flop-Fix allows the use of
ED disks with 12bit and 16-bit FATs.

SERFX20 ... ... by Bill Penner, just like CTSPATCH and TURBOCTS
from the same author, removes the RTS/CTS problem of the serial
port, though for all TOS versions from 1.0 to 4.0x.

SHBUFxx by Martin Osieka: From TOS 2.05 onwards the AES and the
desktop permit the saving of their configuration in the file
NEWDESK.INF (formerly DESKTOP.INF). At switch-on this file is loaded
and evaluated. GEM uses static buffers for internal management of the
file, whose size has not kept pace with the growing capabilities of
the desktop, particularly the icon rules. Thus it can easily happen
that on launching a program one gets the following message: "Can't
allocate enough memory!". With shbuf the size of this buffer can be
increased. If you rename shbuf to shbuf10 and copy it into the AUTO
folder, then a 10KB buffer will be created.
Here too the GEM must lie in RAM, see Arrowfix. Shbuf however is
also able to create a TOS image file from TOS that can then be
burned into EPROMs.

SEEKUP by Martin Koehiing: Seekup switches off the doubling of the
seek-rate on STs under TOS 2.06. This makes the floppy work more
quietly.
>-------------------- end ---------------------

This has been a public service announcement of DDP.

Regards, /Peter/

Do you mean UNDELETE.PRG? I have had the same problems with this on my
14 MB Falcon, with and without MagiC (i.e. even only the TOS 4.0x
desktop loaded asnd nothing else!), so it seems to be a programming
error. Pity, because it looks like it's easy to use (not as easy as
Diamond Edge, but that doesn't work with large partitions).

There is also HiSoft's UNDEL.TTP, but I don't quite know what should
be put on the command line. The drivename alone is not enough.

Regards, /Peter/

Yep, http://perso.wanadoo.fr/didierm is a good example where CAB
tells me the site is blocked. Just tried it on a PC and had no problem
with access. It seems to be the URLs that exclude the 'WWW' that cause
the problem.

Havn't tried Cab 2.8 demo - I'll give that a go

Yes, I did that between my Hades and my STe. What was good about this
setup was that on my Hades a partition icon was produced.
Double-clicking on the icon produced folders, each representing the
partitions on my STe. I could copy, delete and even run the programs.
It was neat running a program on he STe and having it come up on my
Hades. However, if I tried to access the Hades using the STe, the
program crashed probably due to the Hades. Below is the text file
included with the program.

==========

The network uses the MIDI port to allow disk sharing between
two ST's that are both running MX2NET. The remote
drives can be used just like your local drives but they will of
course be slower because of the transfer of the data through the
MIDI ports.

The remote drives are defined in the MX2NET.INF file. This is a
ascii file with the drive parameters all on one line. For example
if you have cfr,dgr,eow in your file.
||| |
/ | \ \
/ | \ \
remote local read write
drive drive access access

You will be able to access remote drive C as your local drive F
read-only. Remote drive D will be G and remote drive E will be O
with write access. If you wish to change the drives simply edit
the MX2NET.INF file, reboot your ST and rerun the MX2NET.PRG.
A max of 14 drives can be defined with P being the highest. If
there is no MX2NET.INF file no drives will be defined locally but
a remote machine still can access your drives.

The MX2NET.OPT file defines program options. It is an ascii file
with all option characters in lower case. Current options are:

t : Get GEMDOS date and time from remote ST.
Normally your "HOST" ST would not have this option
set.

o : Mask over existing drives. If this option is set
it is possible to overlay a networked drive ID
over a real drive on the local ST by assigning
it's ID in the MX2NET.INF file. If this option
is not set a cold-boot is needed before restarting
MX2NET.

m : Allow memory transfers to and from remote ST.
Enables shared memory and remote operation.

5 : Remote ST is 520ST. Screen physical memory is
found at 78000 HEX.

Be sure to cross connect the midi cables ie... the MIDI out to
the MIDI in on the other ST and vice verse.

midi in ___ ___ midi in
ST 1 \/ ST 2
HOST midi out ___/___ midi out REMOTE

The MX2NET.PRG is a standalone network driver that runs from
the DESKTOP or another GEM program. It should NOT be installed
in an AUTO folder. If ST 1 is the HOST it should be started
first then start the program on ST 2.

Drive 31 is a special ID that MX2NET uses for network function
calls. Use the rwabs bios call to access these functions.

A call to this ID to read sector 0 will return the local network
status into the buffer.
Sector 1 will return the remote network status.

A write to sector 2 will send the buffer into the keyboard buffer
in the remote ST. Location 0 in the buffer contains the count
while location 1 is the start of the string. The buffer is an array
0..63 of longs.

A read to sector 3 will return in the buffer an array of checksums
of the remote physical screen memory.
Any read or write of a sector more that 3 will read that 512 byte
section(s) of memory to or from the rwabs buffer.

NOTE:

mx2neta.prg : RS-232 port version.
netstat.prg : read local network stat's.
netstatr.prg : read remote network stat's.
netview.prg : View remote ST's screen
memory. Use the Undo key
to exit.
status record structure

stat = RECORD
inpackets : LONGCARD;
outpackets : LONGCARD;

```
retrys : LONGCARD;
checksumerrors : LONGCARD;
timeouts : LONGCARD;
rwabsreqs : LONGCARD;
resets : LONGCARD;
END;
```

PS It is recommended that this program be used for read-only access
to your remote drives. It is possible to scramble the FAT if
both machines try to write to the disk at the same time.

Which Cab ovl are you using? You should have the newest version.

Aniplayer will attempt to load these SLB files when you do certain things.
I found that they must be in the same dir as Aniplayer or whatever feature
that SLB provides will be disabled.

Put the .slb files in any folder you want, and set environment variable
"setenv SLBPATH /your-slb-path/" in MINT.CNF

You could try ST Tools, I find it very useful, it allows you to check a the
file structure of a disk, it repairs any damage, can optimise (de-fragment)
a disk, has an inbuilt disk editor and Undelete files among other things.
It was shareware, I dont know what its status is now.

lp,

I have found that under MagiC, you can put them in C:\gemsys\magic\xtension
and it will also load whatever the extension the .slb provides from there.
I really hope we get ld.so support for mint at some point. and swap fs.

You might think so after reading the readme that comes with CAB, however
it will successfully open a URL of the form
"homepage.ntlword.com/whoever" without grumbling.

If you're using a version of CAB below 2.5d you're on your own...

Yep, but you must also list the SLBs in the magx.inf file viz:

#_SLB 0 LAME_ENC.SLB
#_SLB 0 OPENDIVX.SLB
#_SLB 0 VORBIS.SLB

Users of Appline/MagiC6.20 will then find these SLBs listed as running apps
in Appline (possibly also in similar utilities).

2367. Wierd STiNG problem

Newsgroup: comp.sys.atari.st
Date: 2002-03-18 16:32:17 UTC
From: Michael and Nicole Freeman <nameerf@flash.net>
Message-ID: <B8BB6505.1F7EC%nameerf@flash.net>
Source record: 36819

Hi!

I was going through my AUTO, ACC, and CPX files trying to get Magic stable on my Falcon (turns out there was an insignificant CPX that was causing all my problems, which I've now disabled). But now that Magic is stable, another strange problem has cropped up. When I boot up, my serial port setup seems fine. I can use Connect to dial into my ISP and see what my login script should be. But once I run STiNG (which then refuses to properly see the login prompts given by the ISP), exit it, and run Connect again, all I get is jumbled random characters instead of the login prompts.

Is STiNG messing up my serial port settings somehow? I've gone through all my files and settings, and can't find anything. When I was messing with files, I changed nothing in my serial or STiNG settings, and I was only disabling files and re-enabling them one at a time (using the .PRG to .PRX renaming method), and the running order doesn't seem to have changed. What can I check to help figure this out? For now I can't connect to the Internet at all with my Falcon, so I can't send anyone any DEFAULT.CFG, etc. files to check unless I type them into my Mac by hand :(~. So if anyone could help, it would be greatly appreciated! Thanks!

Hi,

I found the source for audiodev.xdd version 0.9 and I'm trying to hack
it so it works on my Milan. After changing the MFP addresses and
finding the right compiler parameters, I got it to install itself.
But when I try to play a sample, it crashes the using application with
a bus error at 0xffff8901. This address is the Falcon DMActl register.
The funny thing is that the driver is able to set this to zero during
installation of the driver without problems. I can run the actrl
program to set volume, etc., without problems. Any ideas on what I am
missing here?

The Milan hardware does not have that register, so even if the access would
work, you would achieve nothing.

You have to use the documented X-Bios calls for the soundcard. Mapping the
direct accesses would not work with different types of soundcards.

DON'T do so! I had problems because of this line : when attempting to
save in MP? mode, AniPlayer returned "Can't use Lame_enc.SLB"!
It took a long time before I could find the cause, thanks to Didier's
help. So, the best is just to copy the SLBs in the Xtension folder,
or in the one set in #_ENV SLBPATH=..., and to deactivate at least
the Lame_enc.SLB in Magic.inf!

Message-ID: <ce22d101.0203181127.34d55449@posting.google.com>
Source record: 36825

Hi All

Just updated my AEX page with all the new versions of AEX and also a more detailed description which (IMHO) can be printed and used as a manual for AEX.

http://tamw.atari-users.net/aex.htm

The new Falcon version as well as a NEW STEEM COMPATABLE version have been added.

Also, the ST and TT-HI versions have updates as well....so if you have the old version...Time to UPGRADE to the next. Things like TRANSPOSITION while AEX is playing , plus more CC controls are available.

Also the DR just uploaded some Icons (aex.rsc) to the main DIR of the Atari-MIDI archives site. I need to add it to the page as well.

Some new stuff in development in AEX just around the corner however...so hold onto your MIDI cords!

Remember...This is FREEWARE, so HATS OFF to Dr Ambient (our own Guido!) for coding us some great stuff!!!

> Is your HSmodem config correct ?

I think it is. It worked fine before, I didn't change it, and it looks about the same as it did before (although I've never been technically saavy enough to know for sure what the settings should be, so maybe that's part of the problem?) Also, it's only when I run STiNG that the problem occurs. After that, accessing the serial port with a Terminal program (like Connect) shows problems that weren't there before running STiNG. Wouldn't an HSmodem problem be there whether I run STiNG or not?

Ah, I would like to be enlightened on those matters myself! As far as I know,
TOS4.92 is a beta-test-version which has been floating around for quite
a while and which is the origin of AES4.1. I assume that its legal status
is probably similar to that of other TOSes, i.e. somewhat dubious. On the
other hand maybe it was meant to be distributed for evaluation and testing?
besides, a lot of people have used and widely distributed AES4.1 which is
said to have originated from TOS4.92 so in reality it may be hairsplitting
do discuss now the matter of distribution rights. I don't know.
I have no information on '040 compatibility and as for usability I only
have a very terse text mentioning that its DESKICON.RSC file is not
compatible with that of TOS4.01.

My idea was that, as it is practically available from many places on the
net, together with Mint it might make an instant (not perfect, of course)
multitasking environment in Aranym... I only wish that Mint developers
were willing to create a "single tasking" mode of running programs in
Mint- some important programs need it, and besides, other two multitasking
options for Atari (Magic and Geneva) provide singletasking mode without
any problems- it does not seem proper that it should not be available
in Mint, too... (off topic, sorry)...

Hello post addict (-;

�anyways, what kind of modem (ext of course) can be used on a ST?
�anykind?

Any kind as long they are s�rial.
My advice : Elsa microlink is cheap, is fax/data/voice and is the one I know
to be capable of 230400. I'm very happy with mine. German modem : heavy duty.

Note that ST can't outrun 57600 I think.

I suppose you have to "disable" STing with the STING.CPX module
in Control Panel before using *any* application that accesses serial
port.

BTW if you use MagiC, why not install MagX-Net? With GlueStik it
is (almost) compatible with STing, and *much* better suited for
multitasking.

>Thanks! It worked!
>The docs said that the TOS image files should be in the same folder as
>SELTOS.PRG, but apparently this didn't apply for AUTO folder booting.

If I remember correctly, while AUTO folder programs are executed,
current (default) directory is not AUTO but root. So if the loader
searches for a file in the current directory, in 99% of cases it would
be the same flolder as that of the program- and behaviour during AUTO
startup is consistent with this.

>AUTO booting works fine, but after selecting the TOS image, the machine
>reboots, then runs SelTOS again, so this time I have to cancle any
>selections so that it doesn't reload TOS once again. A bit cumbersome
>-is there a way around this?

If that is a program to SELECT a TOS (as its name suggests), then I think
that this is the only way it should work- i.e. a program can not divine
telepathically when the user wants to select another image and when he
does not. But is it perhaps possible anyway to pre-configure it somehow
to just load a certain image- is there anything in the docs?

Btw. loader named AUTO_206.PRG from TOSPATCH suite checks whether
TOS2.06 has already been installed and does nothing in that case, i.e.
it behaves like what you want.

>Anyone know what the difference between UK and USA TOS is? I would image
>that the UK TOS has things like "color" spelt "colour", but that's not
>the case as the "view" menu on the desktop has the US spelling.
>Any keyboard layout differences perhaps? The Pound sign etc.

Regarding keyboard- US Atari keyboard has one key less than other
keyboard layouts! Left Shift key is longer (covers the place for
the "\|" key of the UK keyboard), "\|" key is to the right of the
Return key, and "#" sign is in place of the Pound sign.

>burning into EPROM chips?

I would be interested to know this, too. Btw. I have never understood why
ASH who, AFAIK, holds the right to both Magic and NVDI, have not made
the effort to integrate NVDI with Magic (and in that case it would have
been possible to put it into EPROMs). So, Magic loads into RAM with
a VDI-equivalent of its own, and practically every user promptly replaces
it with NVDI, wasting the RAM occupied by original Magic's routines.

I suppose you have to "disable" STing with the STING.CPX module
in Control Panel before using *any* application that accesses serial port.

Grzegorz found the right solution, I fully agree with it.

Me again,
Yup! Don't post for years then two in les than 24 hours.

I have also found the box that used to hold my atari's hard drive.
Complete with scsi to atari adaptor.
I will even look for the lead to go between HD & ST tonight.
Any offers?

TTFN
Ade.

There is another program the create/restores .ST files called Makedisk
unlike MSA, Makedisk does not compress the images it produces, its possilbe
that these files were created using it and thats why MSA won't decompress
them. Fortunatly Makedisk will also compress to/decompress from MSA files so
it might be worth getting a copy, however it is a DOS program so I don't
know if it will work on your Mac. If you can't find one I have a copy
somewhere.
Unfortunatly neither program will restore directly to a HD.

2414. TT Malfunction Help

Newsgroup: comp.sys.atari.st
Date: 2002-03-19 09:09:48 UTC
From: John Perez <jhperez@uhunix2.its.hawaii.edu>
Message-ID: <a76v8sjqe1@news.hawaii.edu>
Source record: 36766

Greetings,

I've recently been trying to set up another TT030 from the parts that I have, and have been experiencing unexplained crashes. Unfortunately, I don't know what could be causing this, as the problems seem to occur with each STram board, TTram board, and motherboard that I try. It occurs with a clean boot, or when booting from floppy. The crashes seem random, but happen much, much too frequently for any Atari computer - if this was Windows I would attribute the problems to a corrupted OS installation.

In any case, I would greatly appreciate any recommendations as to software that I might be able to use to diagnose the problems. I don't know if the TT030 diagnostic cart would be of use in this situation, or if there are other Stram and TTram tests that I should seek out.

Any help would be greatly appreciated.

Does it make any difference if I use

setenv SLBPATH /my-slb-path/

or

setenv SLBPATH u:\my-slb-path\

?

I remember occasions where a unix (/) notation wasn't recognized by a GEM
app, and a dos\tos notation (drive:\) wasn't recognized by a mint/unix
type of program. Or am I talking nonsense now ?

yes, IMO a singletasking mode is still important. Perhaps a single
tasking mode is necessary to switch color depth when using an older
application, f. e. a game?

```
> I only wish that Mint developers
> were willing to create a "single tasking" mode of running programs in
> Mint- some important programs need it,
```

Which ones ? I never needed such "single tasking" thing on my F030. I have
one Mint+N_AES set for a normal work, one set with plain TOS for demos,
games,
nonGEM audio software like DigitalHomeStudio, ACE, trackers; and finally one
set with TOS+NVDI+Videlity for software like Cubase, Digitape, Expand,
etc...
All sets managed by Xboot. As you see, this is mostly a Falcon specific
software which will never work under Aranym. In addition I think, that on a
real Atari machine is much better and safer to use TOS for such software
than any "single tasking" mode in a MagiC/Geneva.
Don t get me wrong. I have nothing against the old software, but I really
think there is no any important application which is able to run on Aranym
or other TOS clone and is not able to run under multitasking.

The PurePascal Debugger crashes in multitasking mode.

> I have

The apps which you run in the last two sets, are they incompatible with
MinT or with NAES?
The disadvantage of such a configuration is that you have to reboot if
you want to run a game or other
critical app.

In single-tasking operating systems on Atari debugging is made using Traps
(#4 or #5 I do not remember correctly), and under multitasking systems (eg.
FreeMiNT) this way is no longer valid, you need proper debbugers that make
use of unix signals to work. There are only few that can do it for example
GDB (GNU DeBugger) and there are mostly C debuggers.

Tried that. Couldn't figure out quite how to set it up for just a basic
Internet connection. Same with MintNet, although MagXNet looks a little
easier - waiting for the GEM-based setup program to be released before I try
again. Of course, I have to have STiNG working to download anything for
MagXNet... :(

Nope. All I did was rename everything from ".PRG" to ".PRX" (same for ACC's and CPX's) and then rename them back one at a time. Don't have any clue what might have caused this. I'm sure it's some small thing I overlooked or something, but it's really irritating.

Hi

Thanks for your responses....
Everyone who says they can connect to my problem sites seem to be
using CAB 2.8 so I got the demo version and there was no problem.
Can only conclude that the problem is CAB 2.7!
Thanks

Martin

2429. HP // scanner

Hello everybody,

I would like to buy an HP prarallel scanner, but is it a software on our computer that can use it ?

My good epson 300 ppp become a bit outdated but I'm not sure at all that his drivers would work with the HP...

Regards

Megamodeste

Nova Scan will do many HP scanners and long with a few other programs,
however I do not think any of them support parallel printers, i.e. I think
they need to be SCSI.

The Blitter in the Falcon is a bit pants, my belief is that it is there simply for backwards compatibility as the CPU can do most functions quicker.

If my theory is right then there would be no need for it to run in 256 mode (as STE only had a 16 colour mode) or the blitter simply does not work well with the 256 memory map.

I do not think there is anything wrong with it, I do not think it is used much in the Falcon for the above reasons.

In the begginig, Falcon was designet to have 68000 CPU and such blitter
would be resonable then. A quick rechack to 68030 made blitter ussage much
more less resonable.

In general it is resonable to use blitter for vdi/gem if you do not have
nvdi installed, as original system functionms are slow. But if you have NVDI
you should swith blitter off, as it only slows things down.

Yes agreed, I would recommend reseating all chips, ROM, MMU, etc and anything else that is socket'd, just push down on them, any "ticking" from movement is not a problem as it normally means it was hanging out.

If the crashes starts after some time then maybe you should look at something overheating, when it starts to crash just touch a chip here and there being careful not to burn yourself. This includes the PSU, but do not touch anything in there, this is a method I have heard off but never tried (i.e. do not blame me if it goes wrong); if you suspect the PSU is overheating, browning, etc then you can spray Freezer de-icer onto it, any fizzing indicates a overheating component - can anyone confirm this?

>Which ones ? I never needed such "single tasking" thing on my F030.

For example:
* DynaCADD- the only more-less usable CADD program for Atari;
* Megapaint- a quite powerful bitmap + vector tech graphic program
* Other stuff which has been mentioned here, such as debuggers,
music programs, etc.

Btw. both DynaCADD and Megapaint run (singleTOS) on at least some of
Atari emulators (DynaCADD is more picky).

>Don't get me wrong. I have nothing against the old software, but I really
>think there is no any important application which is able to run on Aranym
>or other TOS clone and is not able to run under multitasking.

If a singletasking mode in Mint were available, the number of "runnable"
programs would be increased, for sure- a lot or just a little- I will not
try to quantify. But, by good or by worse, singletasking software is the
heritage of Atari computers and, as I said, Magic and Geneva have provisions
for that. Why not Mint, too? Or, perhaps, some utility might be designed
for launching such singletasking programs? (to suspend Mint multitasking
temporarily and run a program in single mode- would that be possible?)

>Are there other ways of extracting the data from an .ST file?

There is a program somewhere on the Net, named ST2DISK, which restores
a floppy disk from a .ST file.

There is also a very nice accessory, named DIMFILE, by an Atarian from
Croatia (I think it is the same person who created the ASCII-to-GFA code
convertor) which creates a RAM disk into which it can load a disk image file-
*.ST, *.DIM (E-copy and Fastcopy) or *.MSA, and then you can copy from
the RAM disk to the hard disk. It was able to unpack for me some .ST files
on which ST2DISK was not successful. The accessory can be configured to
subsititute floppy disk A: or B: - but only when a disk-image is loaded,
so that the drives are usable otherwise. It is even supposed to be able to
execute the boot sector of a loaded disk image. Look for it on the Net on
"Croatian Atari page" or something like that.

However, neither of those utilities will much reduce the amount of work
you have to do, because they have to be operated manually, with a ceratin
amount of mouse-pointing and clicking. You would probably need a command-line
driven utility which might be used in a batch job together with UNZIP
or something similar- but I do not know that such a thing exists- though
it should not be too dificult to code- just read blocks from the .ST
file and write them onto floppy sectors in sequence.

Note that it is not possible to copy the contents of all .ST files to a
hard disk- the image may be of a floppy which is not file-structured
(i.e. some game disk).

Hi Stephen!

How do you get ST Tools to show anything other than the partition
it is run from? Mine's version 1.93 by Stephen Cornio, but I have
no docs for it. Also, under MagiC, it doesn't redraw the screen on
quitting (you have to use MagiC's tidy up command).

John,

Have you checked the output of the PSU? If this is low or
intermittent, it could cause the behaviour described.

Also make sure that all socketed chips (if any) are seated
properly - press them down carefully. Might also have oxidized
pins, in which case remove them, clean them carefully with glass
fibre pen and reinsert them, making sure they are the right way
round!

Regards, /Peter/

Hi Pete

| >The problem wasn't the maximum number of open windows. This was limited -
| >but harmless. There was a bug that caused strange problems when you had
| >too many folders on your (hard)disk. I don't remember how many.

The problem was with the number of folders 'visited', so for instance if you opened a window that had a nested folder on it, then the opening of that folder would cause the tree below it to be visited also, adding to the visited folder count. So if this folder was in a tree 40 deep, opening this would freeze the system as the 40 folder limit was hit.

| Steve,
|
| Just so there's no confusion the audio equipment hooked to the falcon
| consists of Paradigm Titan version 2 speakers with 60Hz - 20Khz frequency
| response, a Denon AVR-75 receiver while I can't do the extreme lows
| (20-60Hz) I think my audio equipment is quite satisfactory.. and no I'm
not
| a vynil buff. I don't know what crack whoever is on who wants to make fun
| of me but audiophiles everywhere give high marks to the Denon AVR-75 and
| EXTREMELY high marks to the paradigm titans.

I'm not poking fun at all, quiet the opposite in fact, I compliment your
choice, the spec of your equipment sounds like the typical spec of a Vinyl
junkie, Harmon Kardon would make CD's sound very harsh IMO, hence my
suspicion they were plugged into black plastic.

Hi Hallvard

| Anyone know what the difference between UK and USA TOS is? I would image
| that the UK TOS has things like "color" spelt "colour", but that's not
| the case as the "view" menu on the desktop has the US spelling.

The US machine would want to dominate any other machines it was near to
without actaully being able to take care of itself properly wheras the UK
machine would need an incentive to do anything at all. With a push the UK
machine would get the job done correctly wheras the US machine would only
half finish the job and would then need therapy.

| Any keyboard layout differences perhaps? The Pound sign etc.

The American keyboard is different, I think its got an extra key near one of
the shift keys and no British pound sign. That's a thought, I should now
really call the Pound a kilo following recent legal cases over here.

There is a program called Ghostlink which requires the PC and the ST to
be hooked together via a null modem cable.

Some changes:
/away is more secure.
Identd connection phase tweaked.
DCC send works if you are behind a firewall.
"Check version" now works with my new ISP.

As always see docs for details.
I know I didn't include the URL, but you all know it by heart now right?
:o)

Typing Tutor with Word Invaders for the Atari ST, color and mono.
Includes disk for Amiga also. Box and manual. Just tested on a 1040ST,
kind of fun.
Academy Software San Rafael, Ca 1985

Sorry, US free shipping only. Overseas, if you really want it (and win
it), will have to pay for shipping.

Question:

What was the make, model and year of the car the Dave Small family
owned and was so proud of?

Winner is the first poster to answer correctly. Winner determined by
time mark of reply contained in Google Groups read on MY computer. My
answers are the correct ones (right or wrong:).
As I don't have an ISP newserver, i'll have to rely on Google Groups
to check for winner. My post take several hours to show up. I'll email
the winner, and ask for a mailing address to ship the package to.
Pretty simple, ehh? No arguing, more questions to be posted, more
games offered.
Mike

> fizzing indicates a overheating component - can anyone confirm this?

Dear Elliot and everybody outa the screen,

This advice is spread from bad technicians that don't want individuals to do the job by themselves.
NEVER PUT SOMETHING FREEZING ON SOMETHING HOT. Do you know dilatation and contraction ? When spraying freezer onto a hot chip you risk to contract the external side when the internal stay dilated, and that would result in a 'fissure' (component will break).

A bad techy told me to test capacitors with spraying freezer on it when they are hot, and if I did I might no be able to use my atari any more.

But do you *really* think it is better to close all running
applications, save all the documents you're working with and
reboot the machine just to use a "single-tasking" application?
And then reboot again to return to your standard multitasking
environment?

> temporarily and run a program in single mode- would that be possible?)

Since also GFA interpreter requires the single-tasking mode, an utility
to run it under MiNT in such a way was made. The only problem with
this utility (called BaSTard 3.2) is that it actually does not work
at all ;-)

I believe a direct support for single-tasking mode from the system
would be better solution than an external utility.

This is the version I have, the partitions should be shown at the bottom of screen on the left hand side under the directory window, just click on it with your mouse. If that does not work try holding down shift and clicking them though normally you only need to do that if your both booting up and running from the floppy on order to view the new floppy.
I dont think that MagiC was well established when ST Tools was written (1993?) and so there is AFAIK no support for it or any other replacement Desktop or OS this could be why the screen is not correctly redrawn upon and may also be why (if the above suggestions fail) you cannot access any other partitions.

I understand your point, but I'm not the person that should do it ;) Try talking to FreeMiNT developers - Frank, Konrad, Guido. they seem very friendly and responsive (at least for me ;).

The problem of singletasking mode is not only FreeMiNT problem. FreeMiNT is just a GEMDOS compatibile (with lots of extensions) kernel. What you need too is AES, and for this moment there is no FreeMiNT friendly AES that would work with FreeMiNT, but... (yes there is alway but), long time ago FreeMiNT was able to work with AES present in ROM. This compability has been discontuined, but I think that it would be possible to restore it and produce a special singletasking kernel.

Just ask developers, try to convince them.

Adam Klobukowski

If you will run FreeMiNT under emulators (it runs well under TosBox and
Stonx) you will get the same compability problems.

Emulators are not more compatibile - they run SingleTos. Most of emulators
are not capable of running FreeMiNT.

> try to quantify. But, by good or by worse, singletasking software is the

I don't think so. At least I'm very interested to hear what do you
understand under this single tasking mode. There is AFAIK no difference
inside the FreeMiNT kernel if only one appliaction is scheduled or several
applications. So I really want to know what should be the difference for
the so called single tasking mode (as every process have it's own address
space it's for the application absolutly not visible if there are other
processes or not; there are only some system calls for IPC that allow
communication but I'm sure the programs you speak of don't use that at
all).

The only thing I can imagine is that the AES behave different under the
single tasking mode of MagiC.

2463. [GAME] pmdoom v0.28 (preversion 2)

Newsgroup: comp.sys.atari.st
Date: 2002-03-20 10:02:01 UTC
From: Patrice Mandin <pmandin@caramail.com>
Message-ID: <pmm97a.289.ln@127.0.0.1>
Source record: 36661

Hello,

For those who did not visit my site 10 times a day, I made a new doom version (preversion 2). I added a SDL driver, so I removed gem, vdi, xbios drivers from the binary. You can still have them by recompiling the program. No need to pass parameters anymore, there is only SDL available (except for audio, still not coded).

For the sources part, I made a nice configure script, cleaner to make cross-compilations.

I have the version 1.95 here with docs.
I can send you the archiv.

Here are the changes since version 1.93:

--- cut ---

Version 1.95 of ST Tools adds the capability to save a listing of the
disk contents to a log file, which may then be printed. The fields
displayed in the file window is now selectable by the user. 3D buttons
will be used when running with the appropriate version of AES.

2466. AtarICQ 0.154 released

Newsgroup: comp.sys.atari.st
Date: 2002-03-20 14:01:30 UTC
From: gokmase@bigfoot.com
Message-ID: <366c6d2a.0203200601.7ba960a5@posting.google.com>
Source record: 36663

Since a few things have been fixed/changed/added since last release,
there is a new update available. This time it is however a binary-only
release and you will thus need RSC and OVL from 0.153 package.

Summary of changes:

* The routine for creating the config (add new user) is working again
NOTE: It is still not possible to create a new UIN.

* Pressing CTRL+C when outgoing field was empty crashed aICQ (fixed)

* Removed a faulty which appeared if aICQ was set to display msg dates

* Changes to contact list sliders (seen when having few contacts)

* If a contact that is not present on aICQs local list (might happen
if it was added to server list by ICQ on PC/Mac) is reported as being
online, aICQ will add it to the local list.

* A missing fclose to close scrap.txt when pasting is added

* When resizing msg window to be smaller, empty rows in begining of
the text buffer are removed.

* Program will report if writing logfile to disk was not carried out ok.

* Msg/URL icon will appear in contact list on incoming messages as
long as aICQ sees them as unread

It might also be worth mentioning that AtarICQ is nominated as best
shareware application by readers of MyAtari, so I wish to say thank
you to anyone who nominated us! Whatever you wish to put your vote on,
do make sure to vote before April 7th.

I wonder which ovl he's using? I can't find this back in his posting.
The original cab.ovl doesn't work with Sting.

Then CAB _should_ work.

>CAB.OVL Module in the CAB directory. But CAB does'n work correctly

Which CAB.OVL? With STinG I would recommend the one from:

http://www.netset.com/~baldrick/

Works quite well. There are other CAB.OVL files for different tcp/ip
stacks like IConnect and MinNet so you really must use a suitable STinG
compatible CAB.OVL .

Put the CAB.OVL in the \CAB\MODULES\ directory. Also note the latest
Ackermann OVL might not work with CAB 1.5 so check with CAB 2.8 first.

>38400 or 57600 bps.

I modified my STE so it could handle both 38400 and 57600 but found that 57600 was slower than 38400 when using Sting/Magic. This was mainly due to retransmission of packets dropped because the 8MHz STE just wasn't fast enough. On the other hand, when using GSZRZ for Zmodem transfers, with mouse interrupts turned off, the transfers were perfectly stable.

I would guess not because the atari printer port is a minimal implementation
and it probably does not have enough lnterface lines implemented to drive
the
scanner.

Thats why you can't use many PC Printer Port devices such
as Network Adaptors and Zip Drives on the ST.

Hi Stephen!

Under MagiC the partition icons are *not* shown, unfortunately.
I've tried it again and 1.93 works fine on the Falcon without MagiC.
With NVDI the tree symbols look a little strange and the drive icons
are not visible, but can still be clicked on blindly. With MagiC the
tree is almost unusable (though this could be solved by correct choice
of system font) but the drive symbols neither appear nor can they be
clicked on - as soon as you try and click outside the ST Tools window
the Thing desktop reacts. Ah well, I could live with that and run
with plain TOS when I want to use ST Tools...

Berndt has offered to mail me 1.95 with the docs, so perhaps that
will work better (though somehow I doubt it).

Regards, /Peter/

Cool! Figured some of the "older", more diverse users might remember:)
The answer is "out there" somewhere, just have to do a little Atari
research to find it (which of course was the whole idea:).

Hello,
Someone would have him of infos on differences between the RSC files of type 4 (AES 3.40 and more) and those generated by Interface. Indeed for one same RSC file, the size is bigger when it is generated by Interface 2.33. This is not true that at the time of the utilization of icons color. I perceived of it at the time of the debug of my version 1.3 of Icon Extract. At the time of a safeguard of two icons windows in 256 color, I generated a pure RSC file of type 4. In fashion TRUE COLOR, Interface 2.33 displays him to me of it false colors whereas RSM displays him to me correctly ! I did a to copy - paste to create therefore on Interface a similar and there surprised file, there are more 1500 bytes of difference! Thank you by advance of your help.

Well, I removed in the README files the lines saying you need the PC
version to play it. I will reput them for the next release. So basically:
1 - Get the pc version, unpack it in a directory
2 - Unpack the pmdoom doom archive, put the files in the same directory
3 - Run doom.gtp

Hi "M�gamodeste"

```
| Dear Elliot and everybody outa the screen,
|
| This advice is spread from bad technicians that don't want individuals to
do the
| job by themselves.
| NEVER PUT SOMETHING FREEZING ON SOMETHING HOT. Do you know dilatation and
| contraction ? When spraying freezer onto a hot chip you risk to contract
the
| external side when the internal stay dilated, and that would result in a
| 'fissure' (component will break).
|
| A bad techy told me to test capacitors with spraying freezer on it when
they are
| hot, and if I did I might no be able to use my atari any more.

This is a complete load of shitte, freezing a component is a valid method of
fault finding and has helped me on thousands of faults.

Your source of advise is a complete pratt.

Yes I have installed it in the CAB Modules directory! I tried several
Versions of CAB.OVL
from Dan Ackerman (e.g. 1.4008 and 1.4401) and the CAB.OVL from Oliver
Booklage
which also won't work. I don't know what I schould do? The modules are
recognized
by CAB! But what about the port setting? I mean the TCP port for connecting
with HTTP?
It schould be 8080 per default. With CAB.OVL from O. Booklage, after the
timeout I get
an 'Access denied' message, on every webserver!! Could that be a problem
with
the port settings? Do I have to alter this setting in STing or CAB?

Does ST2DISK handle .ST files that are less than a full disk. One problem I've been having with MAKEDISK is that a lot of the .ST files are only 400k instead of being a full 720 or 800. Makedisk wants to format the floppy to 400k and when I let it do it my ST won't read the disks. Likewise if I force the formatting to 720 or 800 it then makes a garbage disk. I've been thinking of forcing makedisk to try to make a single sided disk but haven't tested that yet and wasn't sure if it would work anyways.

You can try the program *Make_ST* from the demo crew The Removers.
Itï¿½s a small TOS program
<http://removers.free.fr/softs/archives/make_st.zip>

I enjoy Dave Small stories- he's one of the few true geniuses I've
ever known.

I first met him when he came to a M.A.C.E. meeting (MichiganAtari etc)
to demonstrate his 8-bit parallel floppy disk drive. Absolutely
astounding..! Side by side systems set up with a standard floppy
drive on one and Dave's invention on the other- the normal system was
still beeep beeep beeeping long after Dave's had gone blip! and
loaded DOS.

(n.b.- Atari "also" invented a parallel floppy drive eventually, for
the 1450XLD which of course never saw the light of day.)

At an Atari show somewhere in the USA (we hit so many I forget
exactly where it was), Dave learned that I didn't have a Magic Sac Mac
emulator yet, so he gave me his last one. Over my protests that he
should sell the thing and make his costs back he gathered together the
discs and cartridge, found an "official" brown bag package and stapled
it together for me. I found out later he'd been up all night
soldering together as many cartridges as he could with the parts he'd
brought with him, but he still gave me his last one. (I wonder where
that brown bag is now- I'm sure it's around here somewhere.)

Then Dave came back years later to my area when WAUG (WashtenawAtari etc) and WAUG (WindsorAtari etc) co-sponsored an Atari show in Windsor, Ontario Canada. He'd rented a van and driven to the show and we all ended up driving around Windsor in the middle of the night in his van, looking for a store that still sold beer- Dave couldn't believe any country could be so regressive as to stop beer sales at midnight, so we finally had get him to go into the store himself and let the store manager convince him. THEN he wanted to drive back over the bridge into downtown Detroit at 1AM looking for beer- we had to tackle him and convince him that was NOT a good idea.

Very personable, very friendly, very intelligent guy.

When I later read his writeup of the "Warp Drive" car, I had really had to smile.

This version does not work :-(

At least when I tried to run it on my TT (previous versions *did*
work). It starts but does not display the graphics (just some disorted
pixels). I tried it with TOS, MiNT and MagiC, in all TT graphic modes.

It also does not restore the color palette properly: when I manage to
exit it (which is not easy since nearly nothing is visible on the
screen, so I must press ESC, up, Enter, Y and have hope it will work...)
in SingleTOS the graphic mode is changed (so I need to reboot anyway)
but in MagiC only the palette is wrong, but with Jinnee it is enough
to click anywhere on the Desktop to restore it.

Is version 0.28 Falcon-only?

Hello

I have a 1990 Atari Mega ST, 4Mb RAM, keyboard, mouse, separate 250Mb SCSI hard drive (not in atari case, but it works with it and is contemporary), 2 Atari monitors (12"-ish, monochrome) and an Atari scanner. I was wondering if anyone knew an approximate value for these items, or would care to make me an offer. I am really not trying to spam the group, I have these items and they are of no use to me.

All equipment is immaculate, has manuals (except the scanner and monitors) and comes with ~80 floppies of software and an unboxed unused Atari BASIC package. I even have circuit diagrams for the ST. I also have a 520ST, but I don't think this is worth much so I may as well hang on to it for the occasional game session.

You can email me using (mangled for obvious usenet reasons) ben "usual symbol" webtedium "second usual symbol" com or reply to this post.

Thanks in anticipation
Ben Godber

Cosmic Pirate for the Atari ST. Two disk (360k), requires joystick.
Just tested on a 1040ST. Mulit level mission game with astroids to
boot. Outlaw software, 1989. Box, disk and manuals.

Sorry, US free shipping only. Overseas, if you really want it (and win
it), will have to pay for shipping.

Question:
Here is an easy one;
In the United States, Atari Corp. purchased an electronic store chain.
What was the name of their television personality advertising mascot?

Winner is the first poster to answer correctly. Winner determined by
time mark of reply contained in Google Groups read on MY computer.
As I don't have an ISP newserver, i'll have to rely on Google Groups
to check for winner. My post take several hours to show up. I'll email
the winner, and ask for a mailing address to ship the package to.
Pretty simple, ehh? No arguing, more questions to be posted, more
games offered.
Mike

2512. Aniplayer - mp3 decoding error

Newsgroup: comp.sys.atari.st
Date: 2002-03-22 09:52:23 UTC
From: gregory@_SPAMMING_is_A_SIN_.atari.pl
Message-ID: <a7eusmaps1@news.tpi.pl>
Source record: 36715

Hi,

I have come accross a mp3 file that cannot be converted to avr
using Aniplayer. It is played correctly on PC, it also seems to
be possible to play it directly by Aniplayer ("seems" because my
TT is a bit (6x) too slow to play mp3) but when I try to save
the sound in any format (avr, wav...) after 7 minutes 32 seconds
I get an alert box with "stream error" or something ;-)
What's going on? There is plenty of free space on the disk drive,
and it does not seem to be a memory problem since I tried it
with MagiC+NVDI (that takes much memory) and also with TOS to
make as much free memory available as possible - and this message
appeared always at this very point of the converted mp3 file... :-(

Why?

Entering the HTTP_PROXY details in your default.cfg file for STinG should
be sufficient - make sure that they point to the address of your ISP's
proxy server. CAB should pick the details up itself automatically (you
might have to click on "default settings" in that dialog box).

I'd suggest commenting this entry out in your default.cfg file (and
clearing the entry in CAB, if you've set it) for a trial as you don't
really need it AFAICS.

HTH.

The author's web site should have DDP Translation's translation of this
program, however it is for the latest/last version 1.14. Maybe you can
update it there.

You'll find the URL in the "Info" box.

>Also, what version of Emailer would I use with CAB v2.7

Whichever one you like ;-)

2.3h is the latest and last, and as it fixes a bug with folder creation if
you install it from scratch is the one that I recommend.

Needless to say you'll find English translations for this and some earlier
versions on the DDP Translation's page, main URL in sig.

2515. Looking for a game: ZOMBI

Newsgroup: comp.sys.atari.st
Date: 2002-03-22 11:34:49 UTC
From: Piotr Adamiak <apjapj@wp.pl>
Message-ID: <3C9B16D9.A1365C18@wp.pl>
Source record: 36716

Hello,

Does anybody know a good download location for the game titled ZOMBI by
Ubisoft or Infogrammes ?

Thanks and all the best,

APJ

2516. Re: ST to ST via serial

Newsgroup: comp.sys.atari.st
Date: 2002-03-22 12:45:08 UTC
From: mike@bbsgate.interware.R.E.M.O.V.E.T.O.R.E.P.L.Y.it

In uno strano messaggio del 21 Mar 02 Dave Wade (2:333/608.1) scrisse al
povero All :
DW> Could you not use the KA9Q TCP/IP software to link an ST and a PC via
DW> the serial port.
DW> I have never tried it, but I know that KA9Q stuff fits on a single
DW> floppy...

Ho yes and it is still supported, see my home page at
www.interware.it/users/mike, it has a GEM interface now, tought a bit work in
progress as I do not receive feedback.

I use Atari GEM NOS (Ka9q) each day for my internet connections and I
alternate connection directly with a ISDN TA/modem and directly to a PC with
a nullmodem serial cable with Winroute software.

Just to go on, I implemented support for CAB in multitasking systems, but now
left in favor of HighWire, still in early development but will be included as
part of NOS if all goes well, so you will get an all-in-one system.

Ciao, *Mike* mikenews@triesterivista.it www.triesterivista.it

2517. Re: what's this?

Newsgroup: comp.sys.atari.st
Date: 2002-03-22 15:24:40 UTC
From: Glitch <glitch@reboot.com>
Message-ID: <cjim9uoolg8biin22b7ai050l1rbdhsv7f@4ax.com>
Source record: 36717

The text literally translates like this:

It is in perfect aesthetic state. I do not know what is nor for
which is worth. It takes two connectors in the later part, one more
length and another identical one to the one of the cable, reason why
this last one must follow to prolong the connector. The large
connector seems of type SCSI.

Based on the picture and the description I'd have to assume it's a
hard drive of some sort. At first I thought it might be a modem but
there would be no need to daisy chain a modem and there is no mention
of a telephone hookup.

Normally your mp3 file is corrupted, you can try with "without error"
selected in the menu. It's possible than the result is a clic at this
moment inside the wav file.

Regards,

Didier.

Thanks you all for the answers

I suppose it's a controller for a printer (it seemed to me like a HD drive too, but there's nothing about an input for the power, neither a power source), but without the printer. So I think I'm not going to bid... ;-D

> with the port settings? Do I have to alter this setting in STing or CAB?

Is there a change you use a proxy server? If so the right syntax is
(the proxy server I use) proxy.pandora.be:8080, thus without the leading
http://
The proxy server can be set in Cab, see 'options/proxy'

As I'm a MiNT-net user I'm not sure if you have to set this in sting's
default.cfg. Anyway I think it's safe to put a line like this into the
default.cfg
HTTP_PROXY = proxy.pandora.be
HTTP_PROXY_PORT = 8080

>

Now that I have thought a little more, I believe that the "per session" part
of
the problem was only in the older OS's (pre 1.4?). There was a buffer
management error. The buffer management error was corrected, but the
buffer size still defaults to 40 directories. So, by 2.06, the problem was
no longer "per session".

What Steve said about the 40 folder depth sounds familiar. Why it
happened to you on folder 28, I do not know. Since you were getting
error messages starting on/after your 13th directory, I am not sure
how the system was operating at that time--there could be some
combination of effects at work. Another way you should be able
to generate the error, is to create your test directory with 4 folders
beneath it that each nest 10 deep. If you open a window down
to the deepest directory in each of the 4 trees, you should also
get the error.

The "FOLDRxx" adjusts the number of available buffers to reduce the
likelyhood of this happening.

>back/forth between the two computers (and I can't use MSA or any other
>disk-related software within MagiCMac either, as this crashes the
>machine. Probably because it calls some hardware specific routines which
>the Mac doesn't have).

Well then you're probably using an old incompatible version... a version of MSA which works perfectly under MagicMac should now be in your mailbox. It has been patched with FPUPATCH.TTP which is in the MagicMac tools folder. A lot of especially older programs which at first glance don't seem to work, run perfect once they're patched... if after being patched they still don't work try running them in single tasking mode.

>And I haven't found a way of MSA to extract the data to the hard disk
>-it needs a floppy disk for this.
>
>Are there other ways of extracting the data from an .ST file?

There's an application called JayMSA out there that can do this, but your Mac will need to run under minimum OS9 for this. For some reason JayMSA brings down the whole lot when MagiCmac runs on an older OS. IIRC you're using a Quadra 840? So MacOS9 is out of the question....

Cheers from Belgium
Dennis

Hi Mike,

>Of course, I have to have STiNG working to download anything for
>MagXNet... :(

Why don't you try install IConnect which is included with CAB? And if you're able to go online with CAB using IConnect then at least you'll know that the problem lies with STiNG and not with the HSModem settings.
If it works do not delete IConnect, both IConnect and STiNG can be loaded in memory without any problems, you might even join the club and start using the IConnect OVL supplied with CAB to surf in the future.... the two STiNG alternative OVL's have been playing catch-up for years, and for the time being they still aren't as good as the original...

Cheers from Belgium

>MagXNet... :(

Why don't you try install IConnect which is included with CAB? And if you're able to go online with CAB using IConnect then at least you'll know that the problem lies with STiNG and not with the HSModem settings.
If it works do not delete IConnect, both IConnect and STiNG can be loaded in memory without any problems, you might even join the club and start using the IConnect OVL supplied with CAB to surf in the future.... the two STiNG alternative OVL's have been playing catch-up for years, and for the time being they still aren't as good as the original...

Cheers from Belgium
Dennis

Hi Yves,

>I would like to buy an HP prarallel scanner, but is it a software on our
>computer that can use it ?

Forget it....
The only available HP driver is the NovaScan driver which can only drive
scanners with a SCSI port.

>My good epson 300 ppp become a bit outdated but I'm not sure at all that
>his drivers would work with the HP...

The Epson and HP drivers are incompatible. But you could always try to
locate an Epson scanner somewhere ofcourse ;-)
All the GTxxx models up to the Epson 1240 will work with the existing Epson
drivers (GT Look and Epson GT). Unfortunately Epson stopped producing SCSI
scanners in favour for scanners with USB and/or Firewire interface so you'll
have to look for a second hand model...

Cheers from Belgium

Could you give more information:

1 - SDL can use xbios or gem for video.
Which one do you use ? Read the README.SDL file for info.

2 - If you use gem for video, can you precise the VDI you use
(rom one, nvdi, other ?)

3 - I made a program giving info about VDI:
http://membres.lycos.fr/pmandin/download/vdi_info-0.2.tar.gz
(source and Atari binary included). Can you send me the output ?

4 - This is a preversion, so I was waiting for bug reports. The next
version has many corrections (in Doom code and in SDL code).

> Is version 0.28 Falcon-only?

It is compiled for 68020 and higher CPUs. So even Mega ST with a graphics
card and a 68030 board could run it.

Actually a think you can drive a DE-600-e directly form the Falc P-port, I have not managed it yet.

In fact a have a couple of the adaptors if anyone is interested.

>Could you not use the KA9Q TCP/IP software to link an ST and a PC via the
>serial port.
>I have never tried it, but I know that KA9Q stuff fits on a single floppy...

I don't know. Initially I was using an STE to connect to the net and
didn't have a PC. This is how I found out 57600 was slower than 38400
for TCP/IP. A while later I got a PC and used 57600 to transfer files
larger than 1.44Mb each way.

Unfortunately, I no longer have a ST/STE so can't play about with it, so
can't say whether KA9Q would work. I can't see any reason why it
wouldn't connect to PPPD on a Linux box. Windows, on the other hand, is
a different matter...

6 Euro is a lot of money for a useless piece of hardware (and it is *really*
useless unless you have one of these printers!). And if you have such a
printer, you probably have the interface, too.

Only if you have a printer and no interface, then 6EUR would be a good deal

Hi Hallvard

On re-reading this I realise that I meant to say

If I save an open window that contains a folder at the top of a tree 40 deep, and subsequently re-open that window, I have instantly visited 40 folders, hitting the limit.

| The problem was with the number of folders 'visited', so for instance if you
| opened a window that had a nested folder on it, then the opening of that
| folder would cause the tree below it to be visited also, adding to the
| visited folder count. So if this folder was in a tree 40 deep, opening this
| would freeze the system as the 40 folder limit was hit.

Er... what?

IConnect is the slowest TCP/IP stack ever made for Atari. It does
have one advantage, though: it's easy to install, as you don't need
to edit the scripts by hand, all the parameters are to be set using
an easy GEM-based setup application. However, the reason why all
those parameters are saved in a non-ASCII file that cannot be edited
in qed for example, is quite beyond me...

As far as the CAB.OVL for IConnect is concerned: I used it for some
time, and couldn't access some websites that worked OK with the
CAB.OVL for STing. The only thing I found good about it was the
non-blocking IP resolving.

I tried STiK, STiNG, Draconis, IConnect and MagX-Net. The best one
for me is the latter (MagX-Net), because it is the fastest (I don't
know exactly why, I just state the fact ;-)) and it works great in
multitasking.

I think you should remove STing and try to install MagXNet. It's
even easier to configure than STing - you don't need to change
almost anything in the scripts for dial-up. Just give your
DNS in resolv.conf, edit chat-script based on your STing cfg file
and change the first line in the options file so that points to
the modem port.

I am afraid that I can not answer this question with technical details
of what I think happens inside the OS kernel- if I could, I would probably
be able to solve the problem myself :) - but only with manifestations of
the issue: In the task manager of Geneva there is an option "Multitask"
which can be checked or not for particular applications, and in the
Aplications-configuring dialog of desktops usable in Magic (Jinnee, Thing,...)
there is a corresponding item (somewhere named "Run in signle mode",
somewhere named "Parallel"). For programs such as those that I mentioned
(DynaCADD, Megapaint) the "multitask" option has to be disabled in order
for them to work properly (or "Parallel" disabled in Jinnee, etc.).
I also noticed in some docs that there is a value (=101) of sh_wiscr argument
for shel_write OS function, meaning "run in single mode" in Magic- so this
option must mean -something-.

It is quite probable that programs like Megapaint, etc. do nasty things
which should not be done (i.e although they have a menu bar and look like
"normal" GEM programs at first sight, I suspect that they are not such
in reality- they can operate only fullscreen, their windows can not be
resized, it is not easy to call accessories from them, etc. etc.)- but
such is reality; Geneva comes with a list of preconfigured settings
for a considerable number of applications- and the number of those
for which "multitask" is disabled is not small. So, Magic and Geneva
support something called "Single mode", whatever it is, and I think that,
for for reasons of compatibility and software heritage, Mint should
have that too. I am aware that introducing such a thing might spoil
the elegance of the inner design of some details in Mint- but this
is not an ideal world...

Regards...

2551. Best Internet Solution

Newsgroup: comp.sys.atari.st
Date: 2002-03-23 01:35:49 UTC
From: John Perez <jhperez@uhunix1.its.hawaii.edu>
Message-ID: <a7gm5lmkr1@news.hawaii.edu>
Source record: 36745

Greetings,

Back before I had broadband, I tried a few different options with regard to Internet software for the Atari, but a lot has changed since then.

I want to ask for opinions as to the fastest and most stable TCP/IP stack and Internet software for Atari computers.

I intend to set up a NetBSD, Linux, or MiNT server on a TT030 with a Riebl Ethernet card attached to my network, which would server to feed TCP/IP to several computers via null modem on serial ports.

Alternatively, I could attach the TT030 directly to the network, although this would prevent any possibility of using a color video card for the TT (unless any of you know how to attach multiple VME devices.)

Here are some of the options that I am considering:

StiK
STinG
MiNTNet
MagiCNet

Draconis
WenSuite
Cab
Chimera

Please provide any feedback that you can.

Thanks,

John Perez

I disagree. I figured out STiNG no problem and had it up and running within
minutes. I still don't know what to do with MagXNet to make it work, and
I've been trying off and on for a couple weeks.

> Just give your
> DNS in resolv.conf, edit chat-script based on your STing cfg file
> and change the first line in the options file so that points to
> the modem port.

This is good to know, as that's not exactly plainly obvious in the
documentation (at least to me).

Could you give me a concrete example of this? In other words, do you have
some sample files you could send me that work perfectly for a basic dial-up
connection (with the passwords blanked out, of course)? Also let me know
exactly where I need to place these files. I personally couldn't
understand quite what to do with the files (both editting and placement),
even after reading through the documentation. Even though it was a little
clearer than the MintNet docs, it still contains some "programmer-eze" that
boggles me a bit (I'm a musician, not a programmer).

Both MintNet and MagXNet (as well as other similarly documented programs)
tend to think that everyone interested in installing them knows exactly what
syntax to use. Even if it's clear to them, it's not to everyone. I had a
discussion with a computer engineer friend of mine about this. I was working
on a project where I work, and in order to do something in MS Powerpoint
that I wanted to do, it required me to directly access slide code according
to "instructions" I got from an online source, but neither me nor anyone
else I work with knew what to do with it. He came in and was like, "It's
right there in black and white" and couldn't see what our difficulty was.
It's like asking someone who only speaks English why he can't understand
something written in plain French... There is too much assumption about the
knowledge a user has about the way things work.

Anyway, any help would be appreciated. Thanks!

That's a little difficult, as I don't have IConnect. I use the demo version
of CAB (although I don't use it much since I use my Mac for most of my
Internet work). I only use STiNG to download new software to the Falcon, and
to transfer files from computer to computer (between the Falcon, my Mac, and
the computer at work - all via E-mail until I can connect my Mac and Falcon
in a network).

Also, I discovered that my problem not only happens with STiNG, but with
STiK 2 as well. I doesn't with Connect or other Terminal software, but with
these two programs it does.

Finally, could someone send me some help for what the HS Modem settings
should be. I never changed them, but at this point I'm not going to rule it
out. If they somehow are causing this, I don't know what could have made
them do this now, when they always worked before.

So that everyone knows, I do have the HS Modem files (DRIVIN.PRG and
SCC.PRG) in the right order, and STiNG does run after them.

Thanks for your suggestion!

Hi Dennis,

�Forget it....
�The only available HP driver is the NovaScan driver which can only drive
�scanners with a SCSI port.

So sorry)-:

�The Epson and HP drivers are incompatible. But you could always try to
�locate an Epson scanner somewhere ofcourse ;-)

Yes, but I think I won't find that resolution with slides capability for that price.

�All the GTxxx models up to the Epson 1240 will work with the existing Epson
�drivers (GT Look and Epson GT).

I have them.

>Unfortunately Epson stopped producing SCSI scanners in favour for scanners with
>USB and/or Firewire interface so you'll �have to look for a second hand model...

Sorry too !

So if anyone can help to find the commands of the scanner I will do the driver by myself for all of you.

Regards

M�gamodeste

> a 50 pin SCSI connector, or do I need a host adaptor?

Please do not connect anything like an hard drive to this port.
That is an internal expansions (CPU) port.

Falcon normaly do not have an internal SCSI port. Only some modified
models had an internal SCSI port nearly external SCSI port.

Hard drive standard internal is 2.5" IDE

You need a cable from external SCSI2 port to SCSI hard drive.
Some SCSI2 to flat cable adaptors around on Misco magazine.

Regards, Robert

> boggles me a bit (I'm a musician, not a programmer).

I will try to describe how to install it, or at least how I did
install it :-) Hope someone will correct me if anything is wrong...

1) Put SOCKETS.DEV, SLIP.MIF and MAGX_SLD.OVL in your Xtensions folder
(C:\gemsys\magic\xtension\)

2) Put MAGXCONF.PRG in your Start folder (C:\gemsys\magic\start\)

3) Put the etc folder from the distribution anywhere, but it must
be VFAT partition. Note that you have to depack MagXNet distribution
on a VFAT partition, so that to preserve the long file names and
four letter extensions. I have it on C:\network\magx-net\etc\

4) Put magx_rc.net in your Start folder, open it with qed and edit
the line "etc_path" so that it points to the place you have your
etc folder, mine is:
etc_path c:\network\magx-net\etc
No need to change anything else there.

5) Put gluestik.prg in your AUTO folder. Use the one from MagxNet, not
the one from MintNet.

6) In etc\resolv.conf put the IP of your nameserver.

7) Edit etc\ppp\chat-script. Mine looks like that:
""
ATZ
OK
ATDT0202122
ABORT "BUSY"
ABORT "NO CARRIER"
CONNECT
""
sername:
HereComesYourUsername
ssword:
HereComesYourPassword
```

8) Edit etc\ppp\options. Mine looks like that:
/dev/modem2
115200
0.0.0.0:
noipdefault
defaultroute
-vj
connect "u:/usr/etc/chat -f u:/etc/ppp/chat-script"

No need to change anything in the last line. This path is actually
not used ;-) First line should point to the serial port you have your
modem connected to, the second is the speed.

"noipdefault" is used for dynamic IP assignment. "defaultroute" is
quite beyond me ;-) "-vj" has propably something to do with Van
Jacobson compression, but it works equally well with or without it
(at least for me).

9) Enter your password and login in pap-secrets. Replace those "<your
login>" entries. But if you provided them in the chat-script as I did,
it is not really necessary I think ;-)

10) Reboot.

11) Start PPPD_GEM, click on connect :-)

So, to sum it up, you *need* the following files:

GEMSYS\MAGIC\XTENSION\SOCKETS.DEV
SLIP.MIF
MAGX_SLD.OVL
GEMSYS\MAGIC\START\MAXCONF.PRG
MAGX_RC.NET - text config file
network\magx-net\etc\ppp\chat-script
options
pap-secrets
network\magx-net\etc\host.conf - don't change anything here
resolv.conf
domainname - you may specify your ISP domain here
hostname - you may specify your hostname here
hosts ! don't
netmasks ! change
networks ! those
protocols ! files
services ! ...
AUTO\DRVIN.PRG - you need HSmodem.
SCC.PRG
GLUESTIK.PRG - gluestik from MagXNet, *not* the one from MiNTNet!

network\magx-net\utlities\pppd-gem\pppd.prg - dialer
pppd.rsc

..at least it is the way I have it done, and it works great with
STing clients (at least with CAB, Newsie, aFTP and MJM). You may

also add drac_gw.prg to use Draconis clients. And IConnect gateway
might be available one day...

Hi,

This is a short part of the MagiC's documentation:

****

Shared libraries in MagiC from V6.00 onwards

Andreas Kromke
26.10.97
Last change: 10.2.98
English translation: Peter West, April 99

1. What are shared libraries ?
==========

Usually libraries with frequently used procedures are collected in
their own object module and then linked with several programs during
compilation. In that case each program receives a copy of the library,
which is integrated firmly into the PRG file.
Shared libraries, on the other hand, exist as separate files only once
on the hard disk and can be used by several programs, even
simultaneously.

2. Why shared libraries ?
==========

Compared to hard-linked libraries this results in a series of
advantages:

- Saving of storage space on the hard disk. The more programs that use the same libraries, the greater the saving.
- Saving of storage space in main memory (RAM). This only comes into play when several programs that use the same library are loaded simultaneously.
- Systematic maintenance by the programmer: For an update it may suffice at times just to distribute a new library. All programs that use the library will then profit from the update.
Additionally there will be fewer source texts to maintain. When a library has been altered there is no need to newly translate all programs that use it.

Naturally there are also disadvantages:

- Program loading takes somewhat longer; however this is so only if the library has not been loaded yet.
- There may be interaction between updates of various programs. When exchanging a library, several programs may be affected (positively or negatively).
- During installation of a program the files have to be copied to the XTENSION folder or to the first folder specified in the searchlist SLBPATH (from Magic 6), so it is no longer possible to establish easily which shared library belongs to which program.

Remedies, for instance:

- Only place aliases in the XTENSION folder or the first folder specified by the environmental variable SLBPATH (see below).
- Leave the shared libraries in a subdirectory of the program and merely extend the environmental variable SLBPATH in MAGX.INF by this directory (possible from Magic 6 onwards). If no SLBPATH variable exists as yet then one has to enter the XTENSION path in it first.

****

So the best way is to put the files in the XTENSION folder. The only solution for load the SLB (MagiC, MiNT or Metados 2.74 is to use the system's calls, there are a new function (this is another part of the same file):

****

Each library is opened with Slbopen() (opening and closing should only take place in user-mode), during which the following parameters are passed:

char *name The name of the library, in capitals,
including the extension (".SLB"). The
library name is also the filename.
char *path If this parameter is not NULL, then first of
all a search will be made for the library
(the path must end with '\' in MagiC 5.20;
this is no longer necessary in MagiC 6).

The path should be an absolute one, so that
the shared library knows where it lies.
If the parameter is NULL or the library was
not found in the specified path, then a
search is made in the XTENSION folder.
From MagiC 6 onwards the environmental variable
SLBPATH will be evaluated.Like PATH it contains
a list of search-paths, each separated by ';'.
If the variable is defined no additional search
will be made in the XTENSION folder.

****

Aniplayer put his path here (the same directory than ANIPLAY.PRG), so
the 1st of all a search is inside his directory. If the file isn't
found, the system try the SLBPATH and the XTENSION folder.

Inside MAGX.INF, there are for exemple :

#_ENV SLBPATH=C:\GEMSYS\MAGIC\XTENSION

After you can put some SLBs _only_ for the AES extensions:

#_SLB 0 WINFRAME.SLB
#_SLB 0 PDLG.SLB

It's possible to put other SLB here but it's a bad idea for 2 reasons:

1> The saturation of the memory with SLBs not used.
2> It's possible than some SLB created from Unix Library cannot be used
only by _one_ program in the same time. For exemple if you put
lame_enc.slb here the AES load this SLB use 500KB to 1MB of memory
without use it, and when Aniplayer try to use this library, the answer
is than it's already used by another program.

Now, I hope than you have understand how the system works.

Regards,

Didier.

>IConnect is the slowest TCP/IP stack ever made for Atari. It does
>have one advantage, though: it's easy to install, as you don't need

It's also fully Scripter scriptable, so you can load details for several ISPs
from your config file and log on to each in turn for collecting your email.

>I tried STiK, STiNG, Draconis, IConnect and MagX-Net. The best one
>for me is the latter (MagX-Net), because it is the fastest (I don't

I'm now using this as well. It's faster as you say, but ATM at least can't be
scripted. I also can't see that it would be possible to dial different ISPs
without renaming some of the associated control files as well IYSWIM.

Cheers

> and Internet software for Atari computers.

MintNet.
The easiest way is to install the EasyMint package.

> Draconis

You can use any clients from this package under MintNet via wrapper.
But IMHO, there is only one interesting client from this package: Adamas
WWW browser.
I don't like it very much, though.

> WenSuite

It uses it's own dialer/stack => unusable

> Cab

Unfortunatelly, this is still the "best" WWW browser for the TOS platform
:(((((

There are also nice console based WWW browsers Lynx and Links.

My other favourite internet clients are: aMail and aFtp and micq.

>TCP/IP to several computers via null modem on serial ports.

As you want to run under MiNT I suppose MiNTNet is the natural answer?

I use STinG myself to connect a bunch of Ataris together in a network
where one TT has a ROM port Ethernet adaptor and then via null modem
talks to the others in several subnets. Works fine and is easy to setup
if you know how to set up netmasks and addresses in a clever way.

I use Magic, Geneva and TOS, and STinG runs well with all these OS'es. By
having a ftp server on each Atari I can also transfer files easely to and
from the two PC's that are connected to this network as well. And yes,
you can run the ftp server under single TOS as well if you like.

BNET is used to share drives between the Atari computers. It mostly works
well but is not perfectly stable here.

With Weblight you can have a webserver running under STinG. I have kept
mine online now for 1 ï¿½ years with an uptime of 98.5 % so it is very
stable as well. It has really only been unreachable when my ISP has had
problems on there own.

>Here are some of the options that I am considering:
>
>StiK

If you only have an Atari and want to dial in to your ISP, so not for you?

>STinG

My favourite

>MiNTNet

Se above

>MagiCNet

An interesting alternative for Magic users who want MiNTNet capabilities
without running MinT, so not for you?

>Draconis
>WenSuite
>Cab
>Chimera

Really not related to your questions about tcp/ip stacks. I have only tested CAB and it mosty gets the job done. As I do all my news/mail on the Atari I use CAB to display links in messages when I click on them. It is a bit slow but that does not matter too much as I have a semi permanent (ADSL) Internet connection.

MiNTnet for MiNT, and MagiCnet for MagiC. STiNG works fine, but
performance is not nearly as good as with MiNTnet (and probably MagiCnet
from what I've heard). You won't notice much difference with a serial
line, but with ethernet the difference is very noticable. I'm using STiNG
under MagiC and MiNTnet under MiNT on my TT (ROM-port adapter from Elmar
Hilgart) and the difference is striking. It's just so faster and smoother
with MiNTnet.

Riebl? Hmm... I have one, and the drivers for it (both for STiNG and
MiNTnet) are very, very unstable. I wouldn't recommend using it with the
current drivers.

> Alternatively, I could attach the TT030 directly to the network, although

If you can find a second VME-connector, you can just daisy-chain it with
the one already installed. However, not all combinations of graphics cards
and ethernet cards will work.

Ah, so! Thanx for the clarification.

>BTW, there's nothing stopping you to put Magic into EPROM's,
>it's been done before....

I know, but that was not the issue. The idea/question was how to put
Magic (or TOS) into EPROMs together with NVDI and possibly with other
enhancements, too. Sentence "in that case it would have been possible
to put it..." referred to NVDI.

Source record: 36637

Hallo derryck!

D>I also can't see that it would be possible to dial different ISPs
D>without renaming some of the associated control files as well IYSWIM.

Of course it's possible to do so. The directory structure of /etc must be as
follows:

U:\etc\
domainname
host.conf
hostname
hosts
netmasks
networks
protocols
resolv.conf
services
ppp\
chap-secrets
pap-secrets
pppchat.acncity
pppchat.easynet
pppchat.msn
pppchat.tonline
opts\
ACN.opt
MSN.opt
T-online.opt
easy_call_city.opt

pap-secrets is a link to chap-secrets. This one consists of lines like
"MSN" * MSN
(tab-delimited, "username"[tab]*[tab]<password>, with the username being the
same as in the "user" line in the corresponding opts file. One line for each
ISP.

MSN.opt looks like this:

/dev/modem2
115200
debug
noipdefault
defaultroute
noauth
netmask 255.255.255.0

```
user MSN
connect "/usr/sbin/chat -f u:/etc/ppp/pppchat.msn -v -r u:/tmp/connect.rpt "

the corresponding chat file pppchat.msn looks like this:

REPORT CONNECT
TIMEOUT 60
ABORT "NO DIALTONE"
ABORT "NO CARRIER"
ABORT BUSY
ABORT ERROR
"" ATZ
OK atL0
OK atdt010880192658
CONNECT

Note that all of these files must have UNIX line ending!

With files set up like this, pppd-gem will show a popup list with available
providers to chose from. It will then take the opts file, start pppd with the
appropriate chat script and get the password from the corresponding line
(username) in the secrets file.

What's missing might be to set proxy and news server names accordingly.

The above files are for a german internet-by-call provider, which has a public
username and password. Accounting is via telephone bill.

It's planned to include the above shown directory tree (with all files) into
the upcoming new MagiCNet version. At least Vassilis has got it for this :-)

mit freundlichem Gruï¿½ aus Ahornberg
Ekkehard

<snip>

Could be correct, the BJ10ex contained DIP switches to control various different options. When I had one, I had the DIP switches set to Epson mode to allow it to work properly with my STe.
I'm suprised that there are many of these printers left as all the people I know that had them broke them, myself included. We managed to get them to print text and graphics as though heads were blobked even though new cartridges were fitted and the connections were cleaned.

Ah! This is very interesting! :-) Thanks!

I've also raised the possibility of scripting pppd in the same manner as can
be done with IConnect. One can then collect email (and newsgroups) from other
servers during the same session. At least now though it will be possible to
use another ISP in case there are problems with the "default" one.

>What's missing might be to set proxy and news server names accordingly.

I'm sure that it'll come eventually :-)

Vassilis is putting much work into Magxnet.

Cheers!

and it works perfectly. and was in imacualate condition, although the floppy drive was dead. no matter, i have a spare stfm i took the drive from. works great!

one question.. What are those 2 15pin vga style plugs for on the side of the keybord?

were they another useless interface atari came up with that was never used ?

thanks

They are extroa Joystick connectors, and paddle connectory. They are
pc-joystick style bu PC JOYSTICK WILL NOT WORK WITH IT!!! You need a special
connector to use it.

Some games make use of this extended joystick ports.

Adam Klobukowski

Actually they are ports that you can plug Atari Jaguar controllers into.
Normal joysticks can't use them.

Yes you are right that some games use them, for example Chu Chu Rocket can
use them.

Cheers!

James

regarding canon buble jet printer issues, i work in the field of repairng
them and the laser printers.

If your getting print quality issues even with a new cartridge, it could be
a defective wiper blade, or the purge valve or pump is defective, ie when
the carrage comes to clean, the excess ink isnt being sucked away. the wiper
blade is easy to clean and should be regularly, pure alcohol does a good
job. its found on an arm just after the width of the paper path on the side
the carrage comes to rest.

Sorry but your reply didn't appear on the newsserver I use......!
I was surprised to find it on Dejanews.

> 1 - SDL can use xbios or gem for video.
> Which one do you use ? Read the README.SDL file for info.

I read README.SDL but I don't know how I am supposed to change
the mode. I believe I use xbios mode, as I start doom.gtp without
any parameters.

> 2 - If you use gem for video, can you precise the VDI you use
> (rom one, nvdi, other ?)

I have NVDI 5.03. I also tried it without NVDI, so I used the ROM
one from TOS 3.06.

> 3 - I made a program giving info about VDI:
> http:
//membres.lycos.fr/pmandin/download/vdi_info-0.2.tar.gz
> (source and Atari binary included). Can you send me the output ?

It doesn't work. It doesn't show any output, and when I tried it
with "-file out.txt" parameter, it didn't save anywhere any file.
I tried it with MagiC 6.01 and with TOS 3.06.

But I use standard TT-Middle display with NVDI 5.03.

> 4 - This is a preversion, so I was waiting for bug reports. The next
> version has many corrections (in Doom code and in SDL code).

I have Atari TT with 4MB ST RAM and 4MB TT RAM, English TOS 3.06
and standard TT graphic display (640x480, 16 colors).

Previous versions of your Doom port worked OK with standard settings
(I didn't give any additional parameters). They didn't work with
"-graphic vdi" and "-graphic gem" options, because this required
256 colors mode. When I switched to 256 colors (320x480, 256 colors)
it didn't worked as well, showing disorted pixels. But in xbios mode
everything was OK. However, when I changed the graphic mode to ST-LOW
(320x200, 16 colors) which was supposed to be recognised by pmDoom
that was supposed to use 16 shades of gray, I get similar disorted
pixels as well.

With the current version I tried "-graphic xbios" and "-graphic vdi"
but it didn't work. But I'm not quite sure if giving those options
from the command line is a proper way of configuring the current
pmDoom version (docs are a bit unclear, I believe that SDL is the
new library *you* use to write pmDoom, and I don't need to install
anything more, because it is compiled into the binary, or am I wrong?)

They are Analogue ports. intended for use with analogue joysticks, but can actually be used for real time analogue measurements. Build yourself a Servo system for instance, a satellite locator is another possibility.

Source record: 36553

From: northstar2010@_I-hate-spam_yahoo.no (Hallvard Tangeraas)
Date: Fri, 22 Mar 2002 13:30:39 GMT

Hi Hallvard,

>Does anyone know if version 2.1.1. of MagiCMac will run with PPC
>processors, or do I need to upgrade?

You'll definitely need to upgrade.
IMO that update is long overdue anyway... MagiCMac offers all the features
of the Atari MagiC 6.2 version, you've been missing out on quite a lot...

>If I do, how much does an upgrade cost, and where do I get it from (I'm in
>Norway, so the closest location would be preferred). If it runs with a PPC
>processor I guess I can still use MacOS 7.6.1. on a PowerMac.

The fastest and probably most reliable way is to get the update straight
from ASH. The uppgrade can be delivered to you on diskettes or CD, or you
can alternatively also ask to have it sent to you as an email attachment.

>If it runs with a PPC processor I guess I can still use MacOS 7.6.1. on
>a PowerMac.

Yep, but it's advised in the MagiCMac docs to use at least OS 8.0, NVDI can
use the Mac QuickDraw routines and it's also possible to print using the Mac
printerdrivers from OS 8.0 onwards. But considering that you want to run the
latest Mac software you'll need at least OS 9.1, a lot of the recent software
refuses to run under anything less...

>Another thing: knowing that a PPC processor will be in emulation mode
>when running MagiCMac, what will the minimum specs be to get it to run
>as well as the "real" 68040/40MHz processor I'm now currently using?

Speedwise a 603/250Mhz or 604/150Mhz are more or less comparable, it also
depends somewhat on the used MacOS, the newer ones have considerable better
(faster) emulation routines, a G3 or G4 will outrun a 68040/40Mhz at least
with a factor 5... But you'll need to buy PowerFPU (software FPU emulator)
if you run a lot of Atari software that uses the FPU. All the PPC processors
are crap when it comes to emulating the FPU in 68xxx mode. But with PowerFPU
installed however, the emulated FPU is really *fast*.

>But seeing how much software that needs a PPC
>processor I might be looking into getting a second hand PPC Mac.

Before you do take a look at http://www.newsell.de , this firm sells brandnew
UMAX PPC 603 and 604 clones, the machines can be expanded all the way up to a
G4/500Mhz with a Sonnet processor card. They sell configurations ranging from
a barebone tower to a fully expanded G4/500Mhz with USB, Firewire, etc...

Cheers from Belgium

Date: Fri, 22 Mar 2002 23:18:13 +0000 (UTC)

Hi Grzegorz,

>Er... what?
>
>IConnect is the slowest TCP/IP stack ever made for Atari.

It isn't....
If it's slower then STIK or STiNG then I can only say that you haven't configured it properly. Properly configured it's on average at least 10% faster, and if you take the IP resolving in account it can be up to 30% faster. Once Fiffi and Emailer are running as well (after all that's what multitasking is ment for), you'll appreciate the IConnect stack even more. IConnect is one of the few Magic-only programs that takes advantage of the MagiC threads, and it shows...

>As far as the CAB.OVL for IConnect is concerned: I used it for some
>time, and couldn't access some websites that worked OK with the
>CAB.OVL for STing. The only thing I found good about it was the
>non-blocking IP resolving.

Oh no... not again !!! This discussion has been held here before, the last time I asked everyone here to give me a couple of URL's which the IConnect OVL can't handle but are no problem under one of the STiNG OVL's, I'm still waiting...

>It does have one advantage, though: it's easy to install, as you don't need
>to edit the scripts by hand, all the parameters are to be set using an easy
>GEM-based setup application. However, the reason why all those parameters
>are saved in a non-ASCII file that cannot be edited in qed for example, is
>quite beyond me...

It's beyond me why you would need to edit the config file with an editor in the first place since as you stated yourself IConnect can be configured using the "easy Gem-based setup application", there's no need to configure the file by hand, whatever you need to edit can be done easily with IConfig.

>I tried STiK, STiNG, Draconis, IConnect and MagX-Net. The best one
>for me is the latter (MagX-Net), because it is the fastest (I don't
>know exactly why, I just state the fact ;-)) and it works great in
>multitasking.

Except for MagX-Net I tried all of the above as well, maybe you've been fooled by IConfig its "easy Gem-based setup application"... To configure IConnect so that you get the most out of it, you must activate the "profi

mode" checkbox, it's essential since some default values especially in the IP and TCP sections may need to be altered.
Furthermore it's worth remembering that IConnect is the only available stack which is a GemScript client, that all the clients can interact and have the same look and handling, and last but not least *all* the IConnect clients use the Atari protocols intensively. It's stuff like OLGA, Drag&Drop, DHST, Bubble help, GEMScript, AV protocol etc... which makes computing on a Atari fun, call me spoiled but I don't like using apps anymore which only offer the very basic. And although it's a matter of taste I simply like using the IConnect clients better then having to sit and fiddle with what is available for STiK/STiNG.

In this newsgroup there has always been quite a big aversion against using IConnect, even when the STiNG OVL's weren't able to handle cookies or post anything properly, there were people here trying to convince the rest how good they were... I'm not about to start this pointless discussion again, if someone is happy using STiK/STiNG, so be it...

Cheers from Belgium
Dennis

Hi Mike,

>That's a little difficult, as I don't have IConnect. I use the demo version
>of CAB (although I don't use it much since I use my Mac for most of my
>Internet work).

Well, then go and download the latest version of IConnect from the ASH
website, it's freeware.... http://ash.sww.net (go to the CAB section), and once
you've got it download the English translation from the DDP webpages (see sig.)

>Finally, could someone send me some help for what the HS Modem settings
>should be. I never changed them, but at this point I'm not going to rule it
>out. If they somehow are causing this, I don't know what could have made
>them do this now, when they always worked before.

In this particular case the settings are not important, even if HSModem would
be completely misconfigured, you should still be able to make a successfull
connection although most probably not at the best speed ;-)

>So that everyone knows, I do have the HS Modem files (DRIVIN.PRG and
>SCC.PRG) in the right order, and STiNG does run after them.

What is important is how DRIVIN.PRG is set up internally, you can do this
with SETTER.TTP or SETTER.PRG (part of the HSModem package).

>I only use STiNG to download new software to the Falcon, and
>to transfer files from computer to computer (between the Falcon, my Mac, and
>the computer at work - all via E-mail until I can connect my Mac and Falcon

Do these apps like DynaCADD fail because of MinT or when run in a
multitasking AES like NAES?
In the second case, do they run with Geneva and MinT installed? If so,
there wouldn't be any problem but Geneva perhaps missing some features.

AFAIK VDI-Fix should remedey a TOS error, that causes text output from f. e. zip.ttp wildly being written on the desktop and not redirected into a VT52 window. That happens when you use the screen speeder Quick ST without VDI-Fix installed before. Apart from this, Quick ST 2.2 works very well (on an overscanned screen, too) and requires only 30 KB RAM in monochrome mode. I used it on a Mega ST, but it does not work in the TOSBOX emulator. So I wan't to sell it for only 2 EUR plus 1 EUR shipping. Anybody here with interest?

>NEWDESK.INF file?), but it defaults to 16 Kbytes.
>
>Here's what the docs say about this, in German:
> ...

By default SHBUF enlarges the buffers to 16KB. As two buffers
were created when launching GEM, one will lose 32KB of memory
(the other buffers only exist temporarily).
By renaming the program one can alter these values. To do
this, simply enter the desired size in KB after the name.
So if one renames SHBUF.PRG say to SHBUF9.PRG, buffers 9KB
in size will be created and one loses 18KB of memory.

: Wayne

From my experience, most Megafile 60 drives have an MFM 40 Meg drive in it, with an RLL (formats MFM drives to 60 megs with capable drives) to Scsi Adaptec converter board. Some apparently do just have a 60 meg Scsi drive in them, but not too many from what ive seen. So, the bottom line is get a 40 meg half height Seagate drive from an old 286 and replace it. If you can find for example an 80 meg drive, it should format to 120 megs with an RLL controller. Of course, you may also have a 60 meg MFM drive with an MFM to Scsi Adaptec type controller in there. In that case, plugging a 40 meg rated MFM drive in it will drop you 20 megs. However, I expect that you probably have an RLL to Scsi controller and not an MFM to Scsi. You really have to have some experience with MFM/RLL drives to know what you are looking for. If you don't have any experience, I would open up the Megafile, and make a note of the model number and make and try and get an exact replacement. I am guessing that it is some sort of Seagate 40 meg MFM mech that can be formatted out to RLL and you are lucky, because they were really common drives. Go hunting for 286 and 386 machines and you should find a mech somewhere.

Good luck.

Willy

They can also be used as input/output ports (4 to each socket). I think you can also use them as A to D ports (again 4 to each plug). If you want to control something you could consider using them. You need to be in the supervisor mode to do anything with them. I'm not sure you can set each bit individually (use one port for both input & output). The ports are latched for output.

I've been working on this project with a friend, he has the megafile back at
his place again trying to download onto floppy all his notator files before
we open it up. I do have an old RLL drive from a 386, I'll dig it out and
see what it is.
We must have somewhere here the formatting and partitioning software from
the megafile, but what software and drivers would you recommend.
Our other thought is to make use of an scsi Ezydrive that we no longer use.
But that means getting hold of a LinkII or the like, any thoughts.
We do have a Mega1 as well that is functioning, and an STfm for parts.
But the STe is simplest to beef up to 4meg (with plug in 32 pin simms) and
I'll probably try a 1.44 HD conversion on it as well. Just the hard drive to
solve and then we have our dedicated sequencer back again (a great little
work horse for its age)
thanks for your help.

If this is any help, Mike, here is my config for HSModem7 on my TT:

DRVIN.PRG: to modify modem 1 to 57600 Bd;
FASTINT: ON (unless "mystic errors/behaviour" show up, it says here).
EXOPEN: OFF.

MFP.PRG: fixes modem 1 (BIOS device 6);
RSVE: NO
HISP: (dunno)
REPL: u (6 times)
DTR: yes
RBL: 256 (or more)
TBL: 256 (or more).

SCC.PRG: sets modem2 (device 7) & serial2 (device 9) high Bd rates
(so that 134=57600);
M2TT: u
M1EMU: u (not used)
LANBIT, LANEXT, LAN_S2: (off? not used here)
DTRM2: yes (modem2)
DTRS2: yes (serial2)
RBLM2, TBLM2, RBLS2, TBLS2: all 256 (or more).

In hope,
Charles.

I mean clicking in the grey'd part of the slider - representing the
part of the window that isn't visible - which scrolls a page at a
time.

> Personally I think I'd go without the real time scrolling and
> movement of windows, but then again I haven't tried it with NVDI on.

Me too, but there's no accounting for taste! Letemfly has some
interesting options too btw...

That's Poolfx92 I think. It flushes the OS pool frequently enough
for this not to be a problem.

That's about it. CACHEnnn was the official Atari version, but a more
flexible version was NCBCSnnn which allowed you to set different
buffers for the FAT and directory buffers.

FAT buffers cached the directory and file names in the root of the
drive, while directory\data buffers cached what was below the root.
Often you'd need far less FAT buffers, so you could save memory by
having two files named NCBCF50 and NCBCD500 in your AUTO folder.

CACHEnnn made D & F buffers the same.

I don't know if I'm being silly here, but doesn't STinG install
TCP\IP? I thought this would prevent Connect from being able to read
what was coming over the modems.

(Someone tell me if I'm being a bit thick here...)

> STing clients (at least with CAB, Newsie, aFTP and MJM). You may
> also add drac_gw.prg to use Draconis clients. And IConnect gateway
> might be available one day...

Well, I went through and re-evaluated each file (STiNG, HS Modem,
Comms-related CPX's, etc), made no changes in the settings at all, but
"Save"d the settings again the way they were, and suddenly STiNG works now.
So while I had it running, I downloaded the newest MagXNet and related
files. I set it up just as you said, hit "Connect" in PPPD_GEM, and it
seemed to connect well, as far as I could tell. But when I tried using the
various clients (CAB with the CAB.OVL that came with MagXNet, aMail, Newsie,
aFTP, etc.), nothing happened. CAB, for instance, resolved and then sat at
"Connecting to host" (or something to that effect). So I'm nearly there,
just have to troubleshoot some more. Any thoughts?

Thanks again for everyone's help! I'm very glad we have this group, even
with it's occasional troll and argument. It's the most helpful newsgroup
I've ever been in!

Oh! I didn't know it was freeware! I'll have to try that, too! Although if I
get MagXNet working, I'll most likely stick with that.

>> I only use STiNG to download new software to the Falcon, and

I'm working on that. Money is tight right now, so it'll take some time. But
yeah, that's part of my plan... eventually.

I'm also waiting to see if Mario Becroft is still going to do the SCSI
Ethernet adapter. I'd go with the ROM port one, but as I've recased my
Falcon into a mid-tower, and the port is in the back, and I need it for my
Cubase Audio dongle, I can't exactly swap ROM cards very easily.

Another longshot I'm looking into (if anyone could give me more details) is
an Ethernet to RS-422 LocalTalk adapter I saw online. Don't know if that'd
work at all, but it's an interesting idea to see if STiNG or MagXNet and the
Mac would be able to recognize each other through that kind of link.

What happens when you use Newsie? Does it recognise STik is available
(through Gluestik)? Does it resolve the hostname? Does it lock at
a certain point?

> CAB, for instance, resolved and then sat at
> "Connecting to host" (or something to that effect). So I'm nearly there,
> just have to troubleshoot some more. Any thoughts?

Use CAB.OVL from Dan Ackerman (the STing one). I had great troubles
with the one from MagXNet. Note that (from what I know) "Connecting
to host" message means in STing clients that they are doing
tcp_open() call, which is non-blocking in STing, but *is* a blocking
one in MagXNet+Gluestik :-(So if there are some troubles with
it, the application will seem to hang, until it gets a response
from the server...
You might also try ping.ttp (it is in /tool/) to check if it
actually sends/receives data packets.
Note also that (unlike STing) when you exit the dialer, connection
will be lost.

After looking at the ethernet solutions, yet not having access to cable internet, I was wondering if anyone has approached the Highspeed internet access through the phonelines. Any hardware attempts, etc.?

Thanks Brian.

2633. HSModem/Fast Serial

Hi

I have HS modem in all my computers. But one that I recently got has the Fast Serial fix, which is pretty simple all the same. Can I use this instead of HSMODEM with STing?

Just Curious.

BTW, I may have sent these messages twice:-).

Hi Pete

| This has been a public service translation by DDP.

And a damn fine bunch of old git's these guys are. I see there's a lot of their translations available at http://www.cix.co.uk/~derryck/html/ddp.htm, also details of a Computer Club in the UK on a link on the homepage, and its just around the M25, in Cheshunt, Herts. Loads of friendly faces and a free cuppa, free entry for the first visit as well, and you may also get to bump in either 'D' or 'P' of DDP <scary>. 8-)

Dont know about that. They are totally different machines with different capabilities, and rareness.

I think the mega ste in good condition with internal scsi drive is probably worth about £70-80. The fact that the drive is in an external case probably means that the internal ACSI-SCSI board is missing/damaged but it may be worth the same or only slighlty less. The mono monitors (assume they are sm124's) are probably worth £15-20 each, and you didnt say what kind of scanner it was, if its a handheld mono, not much, if its a flatbed colour then being atari compatible will be worth a bit more.

The external HDD is contemporary so I have no reason to suspect a damaged or inop board, I think it's just a matter of space and cooling.

> The mono monitors (assume they are

SM124s, yes.

> and you didnt say what kind of

Flatbed colour, yes.

Cheers.

With SDL, you use environment variables to force a precise video driver,
like SDL_VIDEODRIVER to choose between xbios and driver.

>> 3 - I made a program giving info about VDI: <a target=_top

'-file' parameter seems to not work on TT and Falcon TOS. Under MiNT or
Magic, with a shell, you can do 'vdi_info > stdout.txt' to do what I need.

> With the current version I tried "-graphic xbios" and "-graphic vdi" but

I removed xbios, gem and vdi drivers from the compiled version, to test
SDL. so no need to specify '-video gem, xbios or vdi'. You will only get
SDL.

By the way, better wait next version, there are many bugs corrected.

<snip>
> That didn't last long then!
<snip>

Nope, I've been after a TT for ages and I wasn't about to let it go.

Got it for £100 so it's not bad. Still waiting for a reply from the seller
though.

Oh, whilst I'm thinking about it, It has a German TOS on it, does anybody
know where I may be able to purchase an english version. Also, it has been
put into a tower case, as I want it to be as authentic as possible does
anybody know of anywhere to find an original TT case?
I know the second one would probably be a tall order but if anybody has a
broken TT to sell me maybe I could get both items at the same time.

Thanks for your time

Tim

Michael,

Thanks for the "push" in the right direction :)

After getting rid of the DMA register stuff, the last barrier was the
location of the sample buffers. They were declared locally, which put
them near the top of TT RAM. Doing a "m_alloc" for them brought them
back into ST (DMA) RAM, and it started working.

Thanks,

Milton Horst
Seattle, WA USA

2645. Trying out GEM programming

Newsgroup: comp.sys.atari.st
Date: 2002-03-25 18:03:48 UTC
From: jba4@po.cwru.edu
Message-ID: <3c9f652e.183320123@news.cwru.edu>
Source record: 36497

Hey everyone, I've started to try out some GEM programming. I'm using a TT with gcc and windom (which has some documentation, thank god). But I've run into a very basic problem.

Now, maybe I'm stupid, but all I want to do is create a GEM window (which I can do) and draw some damn lines in it (which I can't do). Ideally, I just want to have a GEM window and draw a line every time a speciifc event occurs. That's all.

So far I've found that when I draw a line (using vdi functions), it immediately disappears. This is probably due to GEM window updates. Is there any way to redraw the window keeping all the VDI drawings in there when it's moved around etc?

I have found that the free documentation for GEM programming online is dismal. I've been looking for quite some time now and there really isn't much to go on. I don't have any books on the subject. Are there any good soure codes that could just help me start on this mission to draw a line?

Thanks for any help!

2646. Wingman Force joystick on MiNT ?

Newsgroup: comp.sys.atari.st
Date: 2002-03-25 18:26:20 UTC
From: Clement.Benrabah@wanadoo.fr
Message-ID: <a7nq4crtd1@wanadoo.fr>
Source record: 36594

Hi,

Does someone have a Logitech Wingman Force and an Atari computer
(or clones) running MiNT in order to test this library:

http://jedi.ks.uiuc.edu/~johns/projects/libforce/

It can be quickly compiled on MiNT and it allows to use this joystick
plugged in a serial port.

The testforce program takes as argument the serial device
(/dev/ttya, /dev/ttyb ...)

Although this joystick is quite expensive and this library doesn't
handle force feedback yet, it would be nice to use this joystick,
especially on Milan/Hades computers.

There are others interesting libraries for high-tech "trackballs"
on this site too.

Clement

2647. Re: mega file 60

Newsgroup: comp.sys.atari.st
Date: 2002-03-25 18:40:19 UTC
From: bm827@FreeNet.Carleton.CA
Message-ID: <a7nqujkv1@freenet9.carleton.ca>
Source record: 36595

SH 204's and Megafile 20's used an MFM drive inside. Megafile 30's and 60's used RLL drives. It is impossible to tell the difference between them by sight, since they look exactly the same. On Seagates, the difference was the letter (R = RLL) following the model number. NOTE that formatting an MFM as an RLL to gain some extra storage space never worked for me (*LOTS* of errors), although apparently it did work for some.

All the Megafiles were built to handle TWO hard drives. This entailed soldering in another set of twenty pins and finding the necessary cabling - not to mention the extra space! It was also necessary to use non-Atari hard drive software since AHDI only recognized LUN 0. I used Supra Hard Drive Utilities with great success, particularly since the number of heads, cylinders, etc., could be set for non-Seagate drives *AND* the driver recognized both LUN 0 and LUN 1.

Atari hard drive software (AHDI & formatters) only allowed a few standardized choices but if I recall correctly it was possible to edit the WINCAP file to get alternate choices. Supra HD Utilities was my brand of choice due to its flexibility.

Hope this helps!

Randy Kwak

Randy Kwak (bm827@FreeNet.Carleton.CA) wrote:
: SH 204's and Megafile 20's used an MFM drive inside. Megafile 30's and
: 60's used RLL drives. It is impossible to tell the difference between
: them by sight, since they look exactly the same. On Seagates, the
: difference was the letter (R = RLL) following the model number.
: NOTE that formatting an MFM as an RLL to gain some extra storage space
: never worked for me (*LOTS* of errors), although apparently it did
: work for some.

I havent done it in a while, but I seem to recall that formatting an MFM drive with an RLL controller either worked or didnt. In my experience, a lot of MFM Seagate drives, had the ability to format out to RLL even if it wasnt specifically an "RLL Drive". I had a lot of luck with Miniscribe 40 meg mechs also formatting to RLL. Of course, if one finds a stash of old MFM style mechs they really are quite inexpensive, and one could purchase a bunch and just see which ones worked and discard the ones that don't.

I used a text file located a few years ago on the net to determine heads and cyliners which is required info. Of course, many of these drives didnt have them listed on their label which is typical.

: All the Megafiles were built to handle TWO hard drives. This entailed
: soldering in another set of twenty pins and finding the necessary
: cabling - not to mention the extra space! It was also necessary to
: use non-Atari hard drive software since AHDI only recognized
: LUN 0. I used Supra Hard Drive Utilities with great success,
: particularly since the number of heads, cylinders, etc., could be
: set for non-Seagate drives *AND* the driver recognized both
: LUN 0 and LUN 1.

Putting another drive in a megafile is possible but really messy. One would be better off taking the controller and power supply and transplanting it into an old PeeCee case. Considering how modest the hard disk requirements are for an Atari, I would personally prefer a nice neat Atari case instead of more storage in a Frankencase. ;-)

: Atari hard drive software (AHDI & formatters) only allowed a few
: standardized choices but if I recall correctly it was possible to
: edit the WINCAP file to get alternate choices. Supra HD Utilities
: was my brand of choice due to its flexibility.

I am sure there are a few broken copies of the ICD formatter too which would work. I got a Megafile 30 a few years back and didnt have the Atari formatting program and used it with success.

I have a strange problem with my Falcon. If I boot with Neodesk and Geneva (I'm using xboot for a boot manager) everything works fine. If I try to boot to the GEM desktop, there are no icons. If I click "install devices" I get the icons, but everything is just named "device" and the folders all just look like files, and I can't run anything. It was working normal just yesterday, and I have tried renaming the auto folder and just booting generic and I get the same result.

Hi Michael,

Grab Gluestik from the Magxnet site and put it in your Magic
start directory. This will sort of emulate Stik/Sting so apps
needing Stik style layer will work. If you want FTP, get the
Mintnet version of aFTP and use the patch on the program.
Hopefully the patch is the corrected one, I had downloaded it
and there was some error in the patch program. Works much
better than the Sting/Stik version. Stable.

Would be nice to have a central place on the web, where one could down-
and /or up-load docs, manuals, tutors, hypertexts, example source code,
libraries, etcetera, for Atari GEM programming. It's easy to get a copy of
GNU c++ for Atari, but hard (read: impossible) to find Atari specific
literature that can still be bought in the local bookshop. And it would be
a shame if the noble art of GEM programming would die and disappear in the
(near) future.

Theoretically yes, but then you would not be able to use STinG-clients with
GlueSTiK under MagiCNet.

MANF>Or do I have to completely change installations and reboot?

That would be the only proper way to do it. But I've been using MagiCNet for
quite a long time now, and haven't used STinG at all since PPPD_GEM has become
available.

Oh, but in fact, while wanting to dominate similar computers nearby,
the US machine will promptly set to short-circuit the PSUs of any
really foreign machines, until those computers are replaced by US-made
remote-boot slave units. It will also try to install resident brain-damaged
short-circuiting programs all around, and be very shocked when those agents
turn back and attack the US machine itself.

As for the UK machine, it will run only programs approved by the US machine
and, moreover, each CPU operation will have to be checked through the
US machine first.

;)

Btw. US Atari keyboard has one key *less*, not more, than UK keyboard.

What you say makes sense and I am not competent to argue with that. I just see that some programs do not work. So, you think that AESes of Magic and Geneva behave differently in some way, significant for this, than, say, NAES or AES4.1 (but also see my reply to Ludwig, below)

Btw. I remember that there was one (beta maybe?) version of Mint in the configuration file of which there was a keyword SINGLEMODE. What was that?

Ludwig Maetzke wrote:

I have just tried Mint+Geneva and those problematic applications all crash the system immediately and in the same way: memory violation, etc. etc. They all run fine with Geneva only. Btw. I am pretty sure that they shoot directly into the screen, not through VDI, which, of course, is not a nice thing to do.

Oh, it is not difficult at all! If you want to display window/folder contents as icons, not text (after all, GEM is a GRAPHIC environment manager), and so you want to assign to each application an icon, assign to each file type an icon, and assign an application to each file type, it is very easy to make a NEWDESK.INF of 20kB or more. If you can have a screen with higher resolution (with many icons on it) it will make things even worse.

Martin,
This is what I plan to do with AtariForge(.net) when I get the
chance. But I'm short on time.. if you are interested in helping set it up
let me know!!
Currently I have AtariForge hosted as a sub-domain on my site,
http://atariforge.atari-users.net (http://www.atariforge.net forwards to
that). I offer free sub-domains, ftp access, bug tracking and mailing list.
I've been looking for a new home for it, a host that allows CVS. The idea
is to have a site that is similar to SourceForge but also has documentation
for people interested in coding on the atari platform. Several coders have
offered to setup pages, like a GFA and C info page.

So if you feel like helping out.. let me know!
Rob

> I have HS modem in all my computers. But one that I recently got has the
> Fast Serial fix, which is pretty simple all the same. Can I use this
> instead of HSMODEM with STing?

Yes. I used it for quite some time. For some reason, I couldn't get HS Modem to work with Geneva, but things worked beautilfully when I tried Fast Serial. No trouble whatsoever. The only downside I saw was that you couldn't change the serial buffer size without a patch like the serial buffer AUTO prg that came with either Wensuite or Draconis (not sure which). Run Fast Serial before the Buffer program in the AUTO folder, and you're all set. Very little setup to do with the thing.

Another downside... It didn't seem to like Magic very much, so I had to switch to HS Modem for that OS. So I use both, depending on the OS I use, and I see little or no difference in the connection speed and stability.

The following message was originally posted to alt.atari.jaguar-discussion,
I though I would re-post it here in case anyone was interested in some of
the items.

Stephen Moss

Greetings all!

Brilliant Development, a long time developer and manager of Atari
products are selling off a few items. If you have any questions or
would like to buy any of the itmes please do not hesitate to email us
at: webmaster@brilliantdevelopment.com All items are in good working
order and being offered here to you before they go to Ebay.

All of the items came from the Borregas ave. offices in Sunnyvale Ca.
and were used to aid in the developing of many of the titles for
Jaguar and Lynx.

The Items:

Atari Stacy Laptop and original power supply

Atari Portfolio Palmtop coputer
comes with: AC adapter, RS232 expansion port, 3 128k mempry cards

Arari Jaglink new in the box

email us for other items which are rare or one of a kind.

Thanks very much!
Have you played Atari today?

Have you tried the Ping tool, perhaps using the address of your ISP's name server to see if you actually have a connection?

And you did unpack the archives to a partition with LFNs as directed in the various readme files?

Cheers

Did you try assigning a proxy server? Might have helped possibly.

Whilst on the subject of Magxnet, I'm trying to get the Samba client working on my Falcon, with an Ethernet connection to my Laptop. I can ping both ways so I know that it's working thus far, but when I try to open a shared drive on the Laptop I get one burst of activity on the Ethernet adaptor and then nothing.

I'd assumed that I needed to activate NetBEUI on the Laptop, but I'm told that this is not necessary - but there's obviously something I've overlooked - but what?

Cheers

2687. Stupid newbie hard drive question

Newsgroup: comp.sys.atari.st
Date: 2002-03-27 14:10:10 UTC
From: Glitch <glitch@reboot.com>
Message-ID: <gmj3aucoj0ktktqie19bfps85kds8m9gd9@4ax.com>
Source record: 36539

Hi,
I originally owned an Atari 520 about 15 (20?) years ago (geesh, I'm getting old) and am now getting a system back together so I can finish a few of the programs I was working on "back in the day". My old system had a supra hard drive and I had no real issues with it and had everything I needed on disk already if I did.

I just recently picked up a Megafile 30 to go w/ my new 520 which seems to be working fine. The problem I am having is when it boots up it starts loading a bunch of hotfixes (folder limit expanders, cache, etc). When it goes to load the cache program the system always bombs. I can bypass the hard drive during boot up easily, and can even boot from diskette fine, so I was wondering what I have to get to boot from floppy and still have access to the hard drive so I can clean out the auto folder. I downloaded the hddriver demo but my poor 520 doesn't have enough memory to run the utility program. How do I set up a bootable floppy that will allow me to see the hard drive?

Thanks,
Matt

2688. HD Drivers and Graphic Drivers

Hi,

1.
I have a Problem, i am looking for the Original Protar Profile HD Driver Packet.
if anyone here have these Drivers please Email me.

2.
In my Mega ST1 with Pak/3 is also a Graphic Adapter with a Texas Instrument TMS34061 FNL Chip. The Name printed on the Card is :

PROTAR 4ML (B)
ST-Graphikkarte 1.1

There is a VGA-Port out and a port thats looks like a Midiport. I need a Techpaper and the drivers for this Card
please help me.

i already posted in German Newsgroups and searchin Internet for this, but nobody can help me.
if you have any Information please Email me.

cya Timo

look for AHDI Files in Version 6.x expand it on a Disk and start the AHDI
when HD is on. these are the original Atari Drivers.
after that u go to menu and now u can mount the HD. i dont know the name of
the menu in english, i own only german TOS.

Check out this URL:

http://www.icd.com/bargains/

OTOH, I seem to recall reading somewhere that ICD wasn't the most
reliable at filling orders these days, so you may want to do some
checking on that. Then too, at $7.95 plus shipping, it's not all THAT
great a risk.

Hello!

I was trying to get to "Tim's Atari MIDI World" on atari-users.net. It said I wasn't logged in, so as I never registered, I went ahead and did that. I received my password and tried logging in, and it kept saying "Incorrect Login". I tried logging in 4 or 5 times, each time making absolutely sure the login and password were *exactly* what was e-mailed to me. Is there a problem there that should be resolved soon? I found no way to contact them on the web page, so hopefully they read this. Thanks!

If I recall correctly you could bypass the HD boot by pressing Shift during startup; ST will go to floppy, then you can run the AHDI driver from there with no other "enhancements" or fixes which could be bombing the thing. Give it a try, it will not do any harm...

Sorry to take so long getting back here. Yes, I've tried with a PC. I'm on my PC right now, using the news server name from my isp web site, the same name I use with Newsie. For what it's worth, I use Netscape 4.79 on a Windows 98 PC and it works fine.

I tried a completely new installation of Newsie, and I tried a couple of old ins files I hadn't used in a while that shouldn't have become corrupted, at least in the same way. Same result. The log says, "Failure to connect with remote server" or, a timeout message.

I just can't understand what might have changed.

Instead of filling in the name of your newsserver in Newsie, try filling
in the IP number of that newsserver. Worked for me when I had similar
problems once.

It could also be that your ISP has changed the DNS nameserver(s)
number(s). Maybe your Windows PC has been set up to automatically fetch
these numbers at login, and everything keeps working as usual.

I remember STiNG can also be configured to do that. I'm not sure, I
haven't used it for some time, since I'm using mintnet now.

Mike,

My host changed IP addresses and messed up all the subdomains. Tim's
site is also available at www.atari-users.net/tamw/ (all other subdomains
can be accessed that way also)

By the time you read this.. the problem should be fixed.

Sorry about that

Rob
webmaster@atari-users.net

I think I found a DIVX file (divx4?) and it still wouldn't display.

I've done everything with the Aniplayer SLB's except for putting them
in the Aniplayer folder. I wonder what I'm doing wrong B^<

Thanks for the reminder. I used to have VDIFIX, but couldn't remember
what for.

QuickST is a fantastic program if you don't need to use NVDI but want
to run a GDOS or non-GDOS setup of any description. It was way, way
faster than NVDI ever was. A Timeworks setup, for example, would be a
joy to use with QuickST.

I'm Emailing it to you seperately, including Devpac2 source.
Note:
POOLFIX3 was Atari freeware
POOLFIX4 was a freeware mod from Claus Brod

> Maybe I need it in my Tos 3,06 ?

It's supposed to be a bug with TOS up to 1.62 AFAIAA

=====
File name: POOLFX92.DOC Revision date: 1992.03.05
Revised by: Ulf Ronald Andersson Creation date: 1992.03.03

File purpose: Document release of POOLFX92.PRG

Since 'Poolfix' has been around for quite a while you may find it hard
to believe that it still contained two quite dangerous bugs:

1: The safe compaction of freed RAM was never made for the gendos
function 'Mshrink', even though it is necessary in some cases.
This error may cause the ROM bug to BOMB your ST.

2: The "safe" compaction itself, which is called for ANY gemdos
function following a RAM release, would often trash register 'd1'
even though all functions except 'Super' are specified to restore
d1 to the value it had on entry to the function.
This error may cause error-free programs to BOMB your ST.

In short, these versions provided a NEW way to BOMB your ST, and this
without even fully eliminating the original bug in ROM.

I have scanned the code both of 'Poolfix3.Prg' and of 'Poolfix4.Prg'
and have seen that both these errors exist in them. 'Poolfix4.Prg'
also has another error which may cause BOMBs when programs need their
own reset-routines linked in.

Since I need a remedy for the ROM bug, I obviously had to make this new
version of 'Poolfix'. I have named it 'Poolfx92.Prg' so no doubt shall
exist of what version is most recent, and this should be the final
version. I really have TRIED to make it BOMB, but it wouldn't !!!

Since this code is based on that of two other authors, I obviously have
no copyright claims to make. This is still FREEWARE, although ATARI
of course owns the copyright.

I have chosen to release the source code for my own version, as well as
that for the two other versions mentioned above. These files are in
format suitable for Devpac 2. They are found with the original 'DOCs'
in folder 'Poolfix', and some definition files are in folder 'TOS'.

These sources are provided mainly so that any user should be able to
see for himself what I have done, in case of doubt.

I strongly recommend that any 'archives' of this program should include
both this document, and the older ones, to keep things perfectly legal.
Unfortunately most "Sysop's" do not realize that removing or changing
a file that holds a program's copyright notice may be against the law,
unless they also remove the program itself from any public access.

I hope you all find this version useful!

I avoid the installer, because I'm so used to duff versions of
ancillary programs (Bubblegem, Olga etc) over-writing the latest
versions I've got and messing around with my inf files. I like to
check these out and do them manually - I just forget the minor details
at times...

What you need is a cross compliler. Gcc is a good example, and it
should be available on any Linux installation. From there, it
is mostly a matter of setting switches, for which you read the man pages,
and of setting target systems, and of having the right library contents.

You many need to learn to use make, and what a diffs file is, too. Anyway,
you have some man pages to read.

The details of how to include asm files in c files should be there.
If the c files are correctly written, the compiler finds the asm file
and assembles it in its proper order.

That was a very general question. What precisely are you trying to do?
A general answer is yes, it has been done, yes, it works, and
how straightforward it is depends on the user's background.

Over on the Amiga channels, the biggest news is the AmigaOne motherboard which hopefully will come out real soon now.

Well, I had a dumb question with regards to the Atari ST, and I figured I might as well ask it. You think perhaps you could get the ST's OS to run on the AmigaOne with some modification? Though, I don't think anyone has worked on TOS since Atari died? I don't know, since I do not follow the ST very well.

Thanks for your answer.
I know how to compile C and asm files on Linux. So if gcc can generate 68000
binary files it is ok.
My question is more about how to create an atari prg file from a set of *.o
on a Linux box ?

Thanks

Olivier

Which version of MagiC are you using Harry? All up to and including 6.10
don't exhibit this behaviour.

Cheers

It is! ;-) I always got the slowest transfers with it (in CAB, aFTP,
Fiffi) compared to MagXNet or even STing... But yes, perhaps I had it
not quite well configured.

> If it's slower then STIK or STiNG then I can only say that you haven't

That's why I changed Sting to MagxNet - with STiNG it is almost
impossible to get e-mail while downloading something using CAB
or aFTP, and with MagXNet it works great!

> >As far as the CAB.OVL for IConnect is concerned: I used it for some

Call me crazy, but I don't like such "mysterious" config files.
I'd like to know exactly what is stored there and be able to edit it
with qed. BTW even NEWDESK.INF (or DESKTOP.INF) is an ASCII file :-)

What exactly should I change there?

I only tried changing MTU to 1500, but it didn't seem to do any good.
Anyway, making MagXNet to work *good* was far less complicated (or
maybe I was lucky) - the only problem I had was due to damaged SCC.PRG.

> Furthermore it's worth remembering that IConnect is the only available stack

I agree IConnect clients are the best ones (for me Fiffi which can
handle several ftp sessions, where the ftp servers on the list can
have unique names and descriptions is much better than aFTP which
does not have those). It's the IConnect itself that I don't like...

I read about this speech synthesis program called Dr. Tiricc that I would like to get hold of, but I can only find one page on the WWW that says anything about it. :(

Does anyone know anything about this program or happen to have this program?

Optigon

Great , I found a good tool: Icon Searcher v1.3
This tool scans all local hard disks for icons of various file formats
and extracts them from files to a more user-friendly visual image
list. This also stores found icons in a database and compresses them.

Hallo !

S>You think perhaps you could get the ST's OS to run on the AmigaOne with
S>some modification?

I don't know the board. Availability of a good 68k emulation would be
essential.

S>Though, I don't think anyone has worked on TOS since Atari died?

Oh well, there has been lots of work done on it. There's the Milan, which has a
PCI+ISA board, with a modified TOS 4 running from EEPROM.

Took a very (and I mean very) quick look on the "official" Amiga website. Basically, the heart of the machine is a PPC. The developer machine also looks to have an A1200 compatible card of sorts for the 68K Amiga O/S compatibility. At this time, AFAIK, there is no port for any TOS compatible O/S that is PPC code compatible. There is (was?) some proprietary development in the works. Might as well purchase MagiCMac if you want to run on a PPC, for cost effectiveness anyway.

Sure is weird how many people are interested in a fast Atari, but there are only about 133 buyers for the CT060. The Falcon might be a few years behind the Amiga 060 development (ok, more than a few), but never the less; it will bring the Falcon up the time line that much further. Personally I attribute that to many Falcon owners specifically using the machine for digital audio, and not for any other merits it has. Those users prefer the compact portable design of the Falcon, the standard TOS interface, and would not normally take on the effort to expand peripherals (other than to plug in a dongle) or use alternative O/S's available to Atari users as a whole.

Atari's Euro market (towards the dark end:) was much larger than in the US. Still, if the Milan 040/060 clones had made available here in numbers, they would have sold. Maybe not in the thousands, but surely equal to the numbers actually sold already. The Medua was another story, and advanced design in it's time, and price accordingly.

Really, the bottom line with TOS, MagiC or MiNT (did I miss any other major developments?) is their exceptional performance on a 68K processor. As far as the O/S side of computing is concerned, all of the above are lightning fast on a 50Mhz 030, direct sun shutter speed on an 040, and will be giggley fast on an 060. TOS applications that are optimized for those processors perform admirably well within the boundries of the platform, and really there is no need for cross pollination with the Amiga platform (at this time).
IMHO,
Mike

The CT60 has a rather severe limitation in that you have to already have a Falcon. When the PAK030 and video cards came out originally, I didn't have the money for them, and I suspect quite a few Atarians were unable to purchase a Falcon when they first came out for the same reason. Now these people are still using STs, but their wallet is a bit fatter than it used to be. Another possibility is that a Falcon in service is 'mission-critical' and unavailable for upgrading. My Falcon serves as my FAX machine (in addition to many other things) and I really don't have the luxury of having it out of service a single day. (Of course, I solved my problem by purchasing a second Falcon, which sits in its box awaiting its CT60.) When you add these two issues to the fact that most Falcons are nearly a decade old (some people are wary about pouring a few hundred dollars into old electronics they don't know how to repair), I think that 133 orders for the CT60 is pretty good.

Thatï¿½s it. Agreed with you and mike.

My 2 cent :)

The price of the new amiga sounds realy good.
Atari Clones much more expensiv any how you can get one?

Nobody that use MagiCMac on power macintosh get an "new" atari or an
CT60. Development is realy good, but it is also a lot of money for an
old falcon and not more as an expansion of an old hardware.

Iï¿½m not sure if its wrong to get a amiga G3 board and try to port TOS /
MagiC - that sounds like an real --- fast ---- atari :)

Hi! I was recently playing a Jaguar game on my SC 1435 monitor, and it went blank, and then a semi-loud ring/hum can be heard, but the power green light is not lit anymore. I don't know whats the problem, but does anyone know who repairs broken these monitors these days? Thanks for any help yoiu could give me,

bnv@antelope.com

2728. The best icon organizer to scan and manage icons

Newsgroup: comp.sys.atari.st
Date: 2002-03-29 07:59:41 UTC
From: iconfun@21cn.com
Message-ID: <ef3da517.0203282359.12cf3808@posting.google.com>
Source record: 36433

Icon Searcher performs fast scan of all local hard disks for icon images. The program handles lots of different file formats, like DLL, EXE, ICO, ICL, OCX ,SCR, CPL ,BPL and extracts all available icons from files to the user-friendly visual image list.

Icons can be saved as separate icon files or copied to the Windows and then pasted into any application, document, or other environment supporting image pasting. This Program store found icons in database and compress them. Icon Searcher uses saving icons as BMP ,ICO ,JPG,GIF files.

Icon Searcher includes the following main features:

* Easy to use GUI.
* Very fast scan speed!
* Found Icons compressed and store in database , saving disk spase.
* Found Icons keep original name and directory name,if icon is extracted ,then keep the extract filename and icon name.
* Icon display 100 icons/page,can jump any page you want.
* Support standard Windows icon (48x48 32x32,16x16) and Custom icon sizes(8x8,24x24).
* 256 and 24-bit true color icons full support.
* Four formats support (.ICO .BMP .JPG .GIF) for saving icons to disk.
* Support copy icon to Windows Clipboard.
* Can be minimized or stop while scanning disks for icons.
* Support Filter icon.
* Support save your own icon collection,you can share with other.
* Support multiselect icons.
* Support view subicon(s).

> The price of the new amiga sounds realy good.

The price cannot be as good, because of small production only for several freaks (same as CT60, xTOS..).
BTW, There were many "comming soon new superamiga" announced since 1994 and none of them was really finished (or at least designed ;).

> Development is realy good, but it is also a lot of money for an
> old falcon and not more as an expansion of an old hardware.

CT60. Well, this would be excellent in 1997, but not in 2002.
Yes it's many times faster than 68030, but still slow for DVD, DivX or at least VCD playback.
However, I want also fast hires graphics with millions colors and dualhead capability, I want ethernet, I want fast ATA IDE, I want use my TV card, I want play games under emulators of various machines, I want sondcard with 5.1 output, I want....

> I'm not sure if its wrong to get a amiga G3 board and try to port TOS /
> MagiC

You can port Aranym/EmuTOS on this machine, but......

> - that sounds like an real --- fast ---- atari :)

.....the PC based solution will be allways way faster, cheaper and hardware developer will never die ;)

Ctirad

>I've just downloaded CAB v.2.8 BetaTest Demo and I can't figure out who to
>E-Mail to get the registration key.

Are you *really* a Atari dealer ? ROTFL....

There is no such thing as a registration key for CAB, when one would like to
obtain the full version then one normally goes and buy it from his local Atari
dealer... if he's unlucky, and has a dealer who doesn't even know how to order
software from the biggest commercial *English* Atari software distributor, then
he better drops that dealer and order it straight from the distributor or the
softwarehouse

>Can someone E-Mail me the right E-Mail address?

I could.... but I rather drop dead :-/
This is USENET !!, if you post publicly then you should be prepared to go to the
trouble reading the replies. You seem to have time enough posting your weekly
rubbish here....

>Or registration instructions in English.

You can order an English CAB 2.8 from the the North American distributor ESNA.

ESNA : http://www.europe-shareware.org
mailto:bengy@euopre-shareware.org

Or alternatively order it straight from ASH, but in that case you'll receive a
German version which you can transform into a proper English one by downloading
the PROPER translation from the DDP webpages (see signature).
ASH : http://ash.sww.net
mailto:oliver@sww.net

>The important thing is I need to be E-Mailed.

Up your nose....

Cheers from Belgium

>or aFTP, and with MagXNet it works great!

I agree! I can now happily talk on irc and know that cab will
carry on downloading in the background without stalling.
Another good point is the stack is generally faster. Ping time
is about 5ms to local host and in Sting it was 70ms!!

Date: 2002-03-29 16:37:12 UTC
From: Michael and Nicole Freeman <nameerf@flash.net>
Message-ID: <B8C9E6AE.20371%nameerf@flash.net>
Source record: 36439

Hi again!

Update: I got MagXNet working (sort of)! As it turns out, there was a file that I had editted (from when I first attempted the installation) that I shouldn't have (oops!). Anyway, now it is at least usable. But there are a couple other problems I've run into:

First, it's incredibly slow compared to STiNG, which from what I hear shouldn't be the case. I most often get download speeds of 400b/s to 1500b/s, where with STiNG I get 2000b/s to 8000b/s (depending on the site), both connecting at about 31200.

Second, I keep getting "** Memory Block destroyed by user program" while downloading sizable blocks of data (even just getting e-mail), at which point the screen starts scrolling the desktop away, replaced by a blank white screen. It does this both with and without MAGTOROM.PRG running.

Any ideas where to go from here? There are no MTU, MSS, or RCV_WIN settings that I can find, which really helped my STiNG connection achieve nice, fast speeds (even faster than my Mac, actually) when I editted them. And I have no idea how to solve the memory block problem. Thanks again for your help!

Hi Galen,

> The CT60 has a rather severe limitation in that you have to already
> have a Falcon.

I've never seen a hard documented report, but assumed that at least
10,000 Falcons were made. Shouldn't be hard to get one. In the US,
B&C, ATY, WEizztronics and Best have them in some form of another.

> When the PAK030 and video cards came out originally, I

I recall the PAK roll out:) I wanted one, but the Mighty Sonic was
available at the time as well. I can't image anyone still using an
STFM and not being content with its performance. Why else would they
use the machine? Those people figure into the numbers, but are the
percent that developers and manufactures have sterotyped into never
upgrading (for whatever reason). I guess money is an object to some.

> Another possibility is that a Falcon

> for the CT60 is pretty good.

Guess that's was kind of what I ment by the digital audio statement. I
don't know that I would use a Falcon as a dedicated fax machine when
one could be had for pennies (pence:) compaired what a nice stock
Falcon brings now a days.

Anyway, 133 orders is great, but surely not the number of times users here have dreamed of a faster machine. The dream has come real, and not many are reaching out to touch.

Money? You can't take it with you. Is it worth pissing it away on a used Falcon and a CT060? Depends if you want a fast Atari or not:)

Can someone please point me to a site where I can get information on how to find out what TOS version I have in my newly acquired 1040 stf?

I have tried transferring files on floppy disk from my pc to the Atari with no luck as yet. I tried renaming the files but am not sure what extension should be used rather than the .st extension on most files.

If anyone can also assist re files downloaded from the internet larger than 720k - are these for later model machines only?

Thank you for any help

Does anything exist? I have the best electronics cable but alas it doesn't work on my 36" VGA TV.

Is there something to double the scan rate provided by this cable so it could display on a 640x480 compatible Monitor?

2743. GFA Basic 3.x file format

I've got no problem at all with Bravo Sierra, I bought a tape from them for about $3.00 which would've been $10-15 on Ebay, and recieved it within a few days. I wish there were more vendors, then we could save even more money.

I would love a CT60 for my Falcon, but the cost is prohibitive for me. I
just can't afford to spend several hundred pounds on something like this,
I have a mortgage and bills to pay first! :-/

How many other Falcon owners are like me? I would think quite a few.

Cheers!

James

Each of these dealers are charging US$800-US$1100 for a Falcon. Only desparate die-hard collectors would pay that much for a Falcon. (and yes, there are people like that)

>I recall the PAK roll out:) I wanted one, but the Mighty Sonic was

>STFM and not being content with its performance. Why else would they
>use the machine?

Because some software only works on the ST such as games, Notator, M, etc. However, being a Notator user myself, I wouldn't mind having it work on a faster machine.

>I guess money is an object to some.

So unfortunately true. :-(

Humm...I don't know your work for create a JIT emulator under your PC
and Aranym, but today with the JIT of Apple used under MagiCMac, you
need a PPC a 2 GHz (just an estimation I have an iMac 500 MHz) for play
a "normal" divx4 352x288 25f/s with an MP3 track. This computer not
exist. Today what do you need for play the same file under Aranym, a PC
a 20 GHz ? This computer not exist. Emulation for me is not the
solution, JIT or not, without native code it's not possible to play the
latest codec created for send latest machines.
About the CT60 you forgot than the Falcon can reduce the CPU load for
decode the MP3 track to 0, because there are a DSP. And the 060 must
only decode the divx. Sure you hope use the Deesse under Aranym but in
how many years ? The Deesse is very different of 56001 because in lot of
cases I think that you need to rewrite the program for use the PCI.
So today you cannot ignore the CT60 solution for update old machines,
and I'am not sure than SDRAM existed in 1997 ;-)

Regards,

Didier.

Depends on the repairman. Most of em have a stack of squeematics of
available tv's and sometimes they need them in order to diagnose the fault
properly. They almost definately wont have the sqmat for the 1435 but you
may get lucky and find a bloke who knows whats wrong straight away.

```

I allways thought that 68k emulation built in MAC OS uses technology similar
to JIT, but I was probably wrong. Our CPU guru saw the sources and said that
it's standard "on the fly" interpreter of 68k instruction code. It is only
very well assembly optimised, it maps m68k registers onto PPC ones, etc...
However, this is not important at all.

The important is, that many people still think that PPC is only the way for
upgrade from 68k, that PPC is something special compared to moderm x86 CPUs
or even that PPC is able to run 68k software directly. That's all wrong !
The only advantage of PPC is the big endian byte ordering and that's all.
Anyway, you need a 68k emulation, same as on the PC.

```
> Emulation for me is not the solution, JIT or not,

Unfortunatelly, emulation is a must if you want a faster CPU than 68060.

> without native code it's not possible to play the
> latest codec created for send latest machines.
```

I don't agree. I don't want to say any rumours about the speed of the
Aranym-JIT, but you can look here http://www.amithlon.com, how fast the 68k
emulation can be. BTW, Aranym uses the same CPU core ;)

```

>

you cant just rename them, you need a program called makedisk
that program will take the disk and turn it into a disk image
and put diskimages onto atari disks for instant atari ST use

I dont know where makedisk can be found, but your favorite search engine
should be able to find it. and if you find it and try to use it, make sure
you are
in dos and not windows

so lets say you downloaded a disk image from atar.st and its a game.
you goto DOS mode (not a DOS window in windows, that wont work)
pop in the 720kb floppy disk (dont use a new disk 1.44mb disk they
wont work for very long) then make sure you use a command that is
something
like

makedisk /write diskimagethatyoudownloaded.st /auto

and but one of those /word doesn't have the / in it.

>
> If anyone can also assist re files downloaded from the internet larger
> than 720k - are these for later model machines only?
>

if its larger than 720k it was not ment to be on a disk.
you will need an ST harddrive and a serial cable to your PC
being a DB9female on one end and DB25female on the other
expect to pay 30 dollars for that cord and perhaps 40$ for
the ST harddrive.

>
> Thank you for any help
>
> New Atari User

and if you want to go on the internet with your ST
you can, but forget it its more trouble than its worth.

you will need an ST modem and ST harddrive
unless you are willing to pay for it, which i cant sadly
you wont be able to do it.

Thats all the help for now :P

i beleive the 1040's had standard double sided internal drives and the early
520's had single sided internal drives, but the machine it self is capable
of using a double sided drive

'Fraid so H, would make absolutely no difference at all. Mind you, if you opened Connect during an Internet connection then you might then be in trouble...

Cheers

Hello.

Easy way to tell.....SS or DS

1. Look inside the drive with a torch. If you see two heads it's DS, if you see one head on the bottom and a felt pad on the top it's SS.

"Oracle" <No.Return@go.away> wrote in message news:viyp8.25882$uR5.57749@newsfeeds.bigpond.com...
> i believe the 1040's had standard double sided internal drives and the early

> of using a double sided drive

Never seen a 520F. (F, not FM)

As standard......

The early 1040f was SS with TOS 1.00 and red lights on the keyboard.

Way to tell the FM TOS is from the GEM copyright date.

1985 is TOS 1.00

'85-'87 is 1.02

'85-'89 is 1.04

STEs are either 1.06 or 1.62.

Source record: 36481

Hi

The problems caused by wdialog and n_dlg are starting to annoy me.
Hooking into the AES vector is something that doesnt fit in the concept of XaAES.

XaAES seems to be good enough now that it is tantalizing to run Jinnee or Ease under
XaAES. But these programs are really designed to run with MagiC.

So as long as I have *not* implemented all the MagiC extensions native in XaAES
programs that need MagiC extensions are not yet supported.

Note that a significant part of the problems is also caused by the fact that many
of such programs do not use the info provided by objc_sysvar & appl_getinfo exhaustively.

Hi Mike,

>Sure is weird how many people are interested in a fast Atari, but
>there are only about 133 buyers for the CT060. The Falcon might be a
>few years behind the Amiga 060 development (ok, more than a few), but
>never the less; it will bring the Falcon up the time line that much
>further.

There's nothing weird about it, but business like usual... personally I'm impressed that 133 people out there are interested in the CT-60. But one would have to know ofcourse how many of these people already use a CT-40 to make a valuable assessment. Another question to ask also is what these people are expecting to do with all that extra power...
Putting a Porche engine into a 1980's Lada doesn't turn that Lada into a Porche, it's just a faster Lada... putting a CT-60 into a Falcon doesn't shift the time line at all. To shift the time line one would also have to add a couple of goodies like a graphic card, fast IDE and SCSI interface, ethernet interface etc... just like the Lada, the Falcon is crippled by its original design.

>Atari's Euro market (towards the dark end:) was much larger than in
>the US.

Sorry, but except for the first year (1985) the Euro market has always been larger. It wasn't only larger but also more inventive. Do you really think that it's pure luck that almost 90% of the software and hardware originates from Europe?

>Still, if the Milan 040/060 clones had made available here in
>numbers, they would have sold. Maybe not in the thousands, but surely
>equal to the numbers actually sold already. The Medua was another
>story, and advanced design in it's time, and price accordingly.

This topic has been shewed on and spit out many times before. To be able selling dedicated hardware, you need dedicated dealers. These dealers are all out of business... what's left is a pitifull bunch calling themselves dealers, this week we've has an exemple here of one of these dealers his experience and knowlegde.... the poor sod asked us where and how he could order a version of CAB !!! Would you order/buy a Milan or CT-60 from that guy? I know I wouldn't.... Unless one is extremely lucky and happens to live in a region where there is a *real* Atari dealer active, one has no choice other then buying through mailorder. The *only* reason why you couldn't buy a Milan in the US was because the American dealers never

ordered any in the first place, which once again goes to show how much
they value their customers.
Milan isn't a large factory, it's just a bunch of very dedicated Atarians
who designed and assembled the computers after a full days work somewhere
in the back of a garage. They never had the resources to go and visit all
the Atari dealers located and scattered all over the world.
Ask yourself how you found out about the Milan, ethernet romport adaptor,
the CT-60 or even some new software..... exactly, here, through internet
and the dedicated newsgroups. If someone wants a CT-60 he'll have to order

it straight from the developer, the chances that an American dealer will
stock them is minimal, and even if they would... would you trust a cowboy
enough to let him have a go with his soldering iron in your Falcon ?

Cheers from Belgium
Dennis

I've experimented a bit. The easiest thing is to have a copy of NOTATOR SL, and export a page into Calamus as an IMG file. All the notes will be set up as they were in NOTATOR, but you can eliminate all the written stuff, where NOTATOR prints them using those nasty GDOS bitmapped characters.

Once the page is set up in calamus, use your text frames and favourite fonts to add the written info. This has the added advantage of allowing you to put the elements where you want them, regardless of defaults according to some MIDI parameter.

Well, "crippled" is not the right word. Falcon was excellent machine in 1993
(or 1992 ?) compared to PCs or any Amiga. Yes, it would be even better with
full 32bit BUS on the expansion connector and without infamous SDMA bug,
however do you really know any computer which is completely bugs free ?
The Falcon design is simply old and you can't expect a miracle from it.

I got three of them for free, all working, including hi-res monitors! But they're ex-school and have some yellow security paint on them, but fortunately only on the back and underside. Two hi-res monitors are cheapo mono VGA jobs with modified plugs, the other Atari SM144 needs the plug replacing since it's loose and crashes the machine. They didn't come with any mice though :-(

>

There is a simple way to get around the bug from within programs.
The 2.06/3.06 desktop could be one of such programs.
I guess more programmers found out how.

The following method lets programs work OK without the arrowfix.

/* short mp[8] is message buffer */

case WM_ARROWED:
if (w->arrowd) /* is there a arrow function for window w? */
{
static int old=0;

/* We dont do it if mp[2] changes to > 0.
Why this all is necessary is not found in any documentation, but it works.
If mp[2] never changes to >0 there is no problem and it works normal.

It seems that if you hold the button down on an arrow, mp[2] becomes >0,
but that in some TOSes the wait time is so short that you get 2 events
on what seems to be only 1 click; one event with 0 and one with x20 in mp[2].
*/
if (!(mp[2] > 0 and old eq 0))
(*w->arrowd)(w,mp); /* perform the arrow function for window w. */
old = mp[2];
}
break

very easierly:
| Windows Floppy Disk Copy 1.02
| http://music-atari.org/atari/emul/diskutil.htm
| There is many others disks utilities on this Web page :-)

Thanks. I still had problems with that one. I guess it may
be the disk format or something. I'll have to get the real
machine out and see if a fresh disk helps.

Anywhere I can download this ?
It was shareware and one of the best games for the Atari.
Another one I'm after is Cybernetix.

I've found info about these but never found a file to
download .

Hi all,

itï¿½s been a while ago for me to post a message in an Atari NG...

1. I tried a Steinberg FA8 (8 individual audio outputs) on a Falcon
running CAF206. Couldnï¿½t get a sound out of it. Do you need an MROS
driver for the FA8? If yes, where can i get it?

2. Iï¿½m still looking for the studio and cuetrax modules for CAF206.

Greetings, Freek Munniksma.

Awesome! I've been waiting for something like this for years!

One question though: Does it work with 100 megabit network cards? (I'm not very familiar with NE2000 except that it was a Novell standard many many years ago.)

Thanks!

Ok. I've dug the .MSA version out of my archives. Hope this works for
you:

> cards built for 100 megabit.

Yes, I have one as a matter of fact! (Which is why I asked) I also have
a 100 mb only hub, which means 10 mb card wouldn't be able to connect at
all.

> But really, there is no point as
> the computer is the limit on the transfer speed. The ROM port

> needs such things ;-)

I see what you mean. 10 mb is much more than the Atari's port can handle
anyway. I guess the real question is: Would the drivers work with a
100mb card...

So, it SHOULD work if the card is NE2000 compatable, right?

2799. Atari ST Software for sale

Newsgroup: comp.sys.atari.st
Date: 2002-04-01 01:23:45 UTC
From: Roy <no.spam@spammers.go.home.com>
Message-ID: <a88cr1mda1@paris.btinternet.com>
Source record: 36355

Hi - Just a quick note to let you know that I've a load of Atari ST
software up on Freeserve auctions. See
http://www.fsauctions.co.uk/Scripts/LotSearch.asp?submitFlag=1&CustNo=14
40938 for details

Cheers,
Roy

2800. Atari Times Update - 3-31-2002

Newsgroup: comp.sys.atari.st
Date: 2002-04-01 03:00:15 UTC
From: "Gregory D. George" <greg@ataritimes.com>

Updates at The Atari Times show up at irregular times. Be sure to check
the site regularly! Here are the most recent updates!

New Articles & Updates:

* NEW! SeaQuest 2600 review
* NEW! Liberator Arcade review
* NEW! Zero 5 Jaguar review
* NEW! Xenophobe 7800 review
* NEW! Check out Jeff's 720 machine!
* NEW! Other little hidden things you probably won't notice!

http://www.ataritimes.com

Don't forget: I still have a few 2001 Issues left. Get them while you
can! http://www.ataritimes.com/store/2001_YearEnd.html

> its original design.

Umm, I have an ATI Mach 64 NOVA, an Expose, 24Mhz motherboard. All of
those will make good use of the 060's processing power. With an
Afterburner, the IDE is plenty fast at 24Mhz bus clock for the demands
placed on the machine. SCSI sucks (~1.8mb/sec) on the Falcon, unless
your using Cubase, why bother? Unless you've experienced a Falcon with
an Afterburner and NOVA graphics, I can see where you might "think"
there is no advantage. You are surely mistaken. As much of an Atari
loyalist that I am, I must admit that a standard Falcon is not very
fun to use. The fact that the CT060 can fit into a standard case with
a powersupply modification is pretty impressive. The machine will
perform on par with machines of the time simularly outfitted, where as
in stock form is a few notches back on the time line.

Using your same automobile logic, why then would Carrol Shelby build a
car that first came with a 289cu/in engine installed with a 427 cu/in
engine? The Cobra handle it just fine, and performance was vastly
increased.

The memory speed of the CT060 alone will make my Afterburner look
sleepy.
I have so many Falcon applications, commercial, purchased, boxed and
manual, that it would take a while to go through the list and detail
the performance increase seen with an 040 installed. If you have
anything other than a news reader installed, let me know, and I can do

some bench marks for you.

> originates from Europe?

Inventive? You call a "Desktopper" or a "LightHouse" case inventive?
Those are trash compaired to a Falcon Rack. The best Falcon ST Ram
card is made in the US. The list of products manufactured in the US
and Canada my not exceed the quanity of hardware manufactured in
Europe, but far exceeds in quality except for maybe a few items.
Wizztronics list is long, but even before them, the most advanced
accelerator for the Atari was built by Dave Small (SST 030 board),
whom also developed Magic Sac and Specter GCR. ICD's Link was around
long before Link 97 and other euro products. Hell, I had to almost get
an Electronics degree just to get a working version of Titan Designs
Expose card. You must have not been around the Atari market for very
long..... I have some STart Magazines you might like to see....

> This topic has been shewed on and spit out many times before. To be able
> selling dedicated hardware, you need dedicated dealers.

Do you know that the last few runs of the Afterburner were
manufactured in a guys garage? Those were sold to the UK by a company
called MW Electronics, and from what I can see of their business, it
isn't much larger than a garage either. Dedicated yes. Many of those
boards made it here to the US. Pitifull, not hardly.

> These dealers are
> all out of business... what's left is a pitifull bunch calling themselves
> dealers, this week we've has an exemple here of one of these dealers his
> experience and knowlegde.... the poor sod asked us where and how he could
> order a version of CAB !!!

CAB is a pretty poor example. It has lacked support for quite some
time. It is a product that was taken as far as possible given the
performance of the platform. Except for a few of the major mainstream
applications in the PC and Mac world, support for them dwendles as
well within a few years.

>Would you order/buy a Milan or CT-60 from that
> guy? I know I wouldn't.... Unless one is extremely lucky and happens to
> live in a region where there is a *real* Atari dealer active, one has no
> choice other then buying through mailorder.

Mailorder has always been the nature of the beast when dealing with
Atari products. I'm sure you didn't have several local dealers to
choose from even in it prime.

>The *only* reason why you
> couldn't buy a Milan in the US was because the American dealers never
> ordered any in the first place, which once again goes to show how much
> they value their customers.

This is a false statement. Unless I was flat out lied to, which I
doubt, there were at least two "small time Atari hoods" that were
attempting to stock Milan boards. The Milan was suppose to be
available as a "kit", and for whatever reason after their
introduction, the "kits" were not made available, at least to the two
who inquired about them. The Atari dealers that existed here in the US
were the most friendly, reliable people I have delt with. I can only
think of one developer long ago that acutally burned some people,
which was back in the 8 bit days. What a pissed off attiuted you have.

> Milan isn't a large factory, it's just a bunch of very dedicated Atarians
> who designed and assembled the computers after a full days work somewhere
> in the back of a garage. They never had the resources to go and visit all
> the Atari dealers located and scattered all over the world.
> Ask yourself how you found out about the Milan, ethernet romport adaptor,
> the CT-60 or even some new software..... exactly, here, through internet
> and the dedicated newsgroups. If someone wants a CT-60 he'll have to order

When the news of the Milan was released, I doubt they had to go
anywhere to promote their product. I don't know what the reason was
for it's low production. I would think that it wasn't supply and
demand, but the demand on the supply. At any rate, Falcon owners,
those that have been around for at least some length of time, will
have known of the CT060 developement for some time, and how to purchse
one. My only statement in the original post was that 133 orders seems
low compaired to the number of times that users have wished for a
faster machine. I paid $530.00 for a Mighty Sonic when they were
released, $600.00 plus for an Afterburner, $250.00 for an Expose, and
around $400.00 for a NOVA Graphics card. Surely the cost of the CT060
doesn't mean squat to me. I'm a Falcon user, and if there is a way to
purchase it, I will. There is no consideration in my mind if it is
cost effective, only that I want it. Mr. Czuba has made it pretty easy
to order, and considering his past record, is a reliable developer.
>
> it straight from the developer, the chances that an American dealer will
> stock them is minimal, and even if they would... would you trust a cowboy
> enough to let him have a go with his soldering iron in your Falcon ?

Yippie Kiayyy, all hardware on this users Falcon is self installed.
And partner, let me tell you sumthin. If yur Falcun is needin fixin,
Alex at ATY Computers can fix you right up. Best damn repair in town,
and makes som hot galdern chile to boot! Tell em mike set ya!@

Happy Trails,
Mike

With an DMA/SCSI transfer maximum of 1.8K/Sec?

With an half CPU what need an extra "Busemulation" as in form of four
GAL chips, that it can work?

With half the cpu clock of an one year older atari tt?

Sorry :)

1994er developers can make it better as it exist.

Regards, Robert

In France we have to wait 3 to 6 month AFTER the dealer got the money, an d be a bit lucky, to get our Had's from the so called dealers living near the Swiss frontier.
When asking for anything directly to Medusa Computer System, we were served within two weeks, wherever country the board was send from and to.

I don't know any customer service better than Aschwanden's one, and Had's owners from Sweeden said the same.

> With an DMA/SCSI transfer maximum of 1.8K/Sec?

As said. The slow SCSI was better than no SCSI at all. In additon, the usual HDD drives avaialable in 1993-1995 were not faster than about 1MB/s.

> With an half CPU what need an extra "Busemulation" as in form of four
> GAL chips, that it can work?

So once again. I never said that Falcon design is perfect, only that Falcon030 was better than PC386 or Amiga4000.

> With half the cpu clock of an one year older atari tt?

TT has 32MHz CPU, but the BUS is only 16MHz one. Anyway, the Falcon030 was never designed as a successor of the TT workstation (the Falcon040 was, but unfortunatelly it was never relased). It was designed as an STE successor with great multimedia capabilities. I was simply not only a slightly modified ST with a faster CPU, but something completely new. How many 1993 computers has DSP, 16bit sound IN/OUT or truecolor ?
I think the falcon is the only reason why the 32bit Atari scene still lives.

Hi Grzegorz,

>>Once Fiffi and Emailer are running as well (after all that's what
>>multitasking is ment for), you'll appreciate the IConnect stack even more.
>
>That's why I changed Sting to MagxNet - with STiNG it is almost impossible to
>get e-mail while downloading something using CAB or aFTP, and with MagXNet it
>works great!

I can't comment on MagXNet since I haven't used it yet, but I've always had and made here strong reservations about using STiNG. The point I was trying to make is that if someone who still uses an ordinary dial-up connection and hasn't got any computers tied in a network doesn't really need to use MagXNet. IMO it's more or less overkill. IConnect will work just as good, and in certain cases even better.

>>There's no need to configure the file by hand, whatever you need to edit can be
>>done easily with IConfig.
>
>Call me crazy, but I don't like such "mysterious" config files. I'd like to know
>exactly what is stored there and be able to edit it with qed. BTW even
>NEWDESK.INF (or DESKTOP.INF) is an ASCII file :-)

One could argue that a config file which contains sensitive data like password(s) and the username *needs* to be unreadable. I like editable config files which can be edited in an ascii editor just as much as you do, but in this particular case I think it was a good idea to build in some form of protection....

>>You must activate the "profi mode" checkbox, it's essential since some default
>>values especially in the IP and TCP sections may need to be altered.
>
>What exactly should I change there?
>
>I only tried changing MTU to 1500, but it didn't seem to do any good.
>Anyway, making MagXNet to work *good* was far less complicated (or
>maybe I was lucky) - the only problem I had was due to damaged SCC.PRG.

Well it depends a bit on your ISP his settings, so you'll have to fiddle a little with the IConfig settings to get the best results.

In the DNS section change:
Query timeout => 10
Query retries => 6
Cache => 75

In the SOCKETS section change:
Max. ports => 7999
Max. baklog => 32

In the PPP section change:
Timeout => 750
Max. NAK => 8

In the TCP section change:
Receive Window => 4096
Sens window limiter => 1024

In the UDP section change:
UDP Sockets => 96

In the IP section change:
Icoming que => 30
MTU => 1480

Note that 1480 is the maximum value that should be set for MTU, 1500 is not a valid entry and Iconnect will use its default (576), the same thing applies for the other settings, if an unvalid number is entered the default number is used instead.

>I agree IConnect clients are the best ones (for me Fiffi which can handle
>several ftp sessions, where the ftp servers on the list can have unique names
>and descriptions is much better than aFTP which does not have those). It's the
>IConnect itself that I don't like...

You just need to configure them properly.... IConnect and his clients have never been popular here in this group. So there's actually very little info available about them and how to get the best performance out of them...
But let's put it this way: I've been using ASH Emailer for nearly five years now, the database file is 275Mb large and contains nearly 20.000 postings and roughly 4.000 mails, I never lost one single posting. I remember playing with crap like Newsie, MyMail, aMail etc and experiencing all kind of weird problems after a certain period. They all work fine in the beginning, but once those apps got to start managing a lot of files.... it's finito.
IMO a program like Newsie shouldn't be even mentioned here anymore, have you any idea how many thousands of postings have been devoted (and still are) to that piece of crap? it's crappy apps like Newsie that are partly responsible for people switching platforms !!
Except for Okami there is nothing out there that can beat Emailer, but once one has a large collection of posting & mails like I do, Okami slows down to an unacceptable speed on a normal Atari... as for the other IConnect clients anyone which is seriously into IRC should have at least *tried* Chatter before simply dismissing it because it's an IConnect client. People who are into Telnet will just love Teli and as for FTP, well you've said it yourself... What's missing is an ICQ client, it was rumoured that there was one in the pipeline but it's bound to stay there :-(
BTW: anyone who maintains a website should really use Fifi or at least give it the benefit of doubt, there's a very nice GEMscript available for Fiffi which turns the tedious task of updating and/or maintaining websites as simple as a mouseclick....

Last but not least, the transfer speed of IConnect will *hardly* slow down when several clients are used at once unlike with the STiNG/STiK stack. And yes I know that MiNTNet doesn't slow down either, but to use this stack MiNT needs to be installed, as for MagXNet, as long as the IConnect bridge isn't publicly released I'm not going to try it out. I'm fed up using unreliable/outdated clients....

Just my two cents worth.... ;-)

Cheers from Belgium
Dennis

2807. EtherNEC now ready to buy

Newsgroup: comp.sys.atari.st
Date: 2002-04-01 10:27:44 UTC
From: Lyndon Amsdon <bindon@madasafish.com>
Message-ID: <3ca836227b96d0@madasafish.com>
Source record: 36479

Hi!

This is a device to allow you to connect an Atari to an ISA NE2000 network card. This comes after working with Dr. Thomas Redelberger. It connects to the ROM port, or cartridge port as some people call it. Stacks supported are Sting, Magicnet and Mintnet.

Please see my website for details, things will take some time first of all as I have little capital and stock but hopefully the profits from first will go to making more and so on.

http://hardware.atari.org/ether/index.htm

If you want to create your own boards (GNU), read up on the drivers or know how the hardware works please see:

http://home.arcor.de/thomas.redelberger/index.htm

Thanks!

Hi

Cant you guys just for once cherish anything ppl try to do? Ct60 is brave attempt and Rodolphe works hard to make it.. Can't u just cheerish that, say a word of apreciation?? Instead of constant bashing and crapping persons which actualy do something... If falcon etc is so crappy, then get a PC (well u all have it already) an emulator and be happy.. U wont pay a penny for CT60/tempest, noone ask u do cut anything from your mouth, so is really all that bashing necessary? I didnt see so flappy and wide description of a word "fan" as i see it here... basicaly anyone with real Atari is constatly bashed.. And for all Falcon haters: name one machine from 93 which can play full stereo mp3's, Cubase audio with 8chans and realtime effects, softsynth like ACE etc etc, without modifications.. computer is not only gfx res and cpu speed..

IConnect just doesn't have the clients I need. I need freeware/shareware clients too. You just can't get a full set of clients for IConnect without spending a lot of money.

Sting has all of the clients I need: Newsie (News, Email, FTP), GapFTP, Finger, AtarIRC, AtarICQ.

>>I agree IConnect clients are the best ones (for me Fiffi which can handle
>>several ftp sessions, where the ftp servers on the list can have unique names
>>and descriptions is much better than aFTP which does not have those). It's the

OK Fiffi is good, but expensive.

>IMO a program like Newsie shouldn't be even mentioned here anymore, have you any
>idea how many thousands of postings have been devoted (and still are) to that
>piece of crap? it's crappy apps like Newsie that are partly responsible for
>people switching platforms !!

Why are you against Newsie? It's probably the easiest to use email program around, I have a friend who can't cope with more difficult programs (due to a learning difficulty) but he copes with Newsie.

Sure it's got it's faults. But what program doesn't? Sure in it's early days it wasn't stable, but in it's latest version v0.961, it is now very stable and all famous bugs that people have spoken of have been fixed.

However it is a great example of a multi purpose program. Newsie does News and Email like Emailer, but does Emailer do FTP as well? I've never heard of it doing that. So therefore Newsie beats Emailer on this point hands down.

Emailer was probably written by a team of programmers, being a commercial release, but Newsie was written by one man, John Rojewski. This makes it a bigger achievement than Emailer.

Just my tuppenny's worth.

Cheers!

James

Yes Ct60 is a brave attempt, and hopefully it will soon hit the streets
and recieve full appreciation. I hope anyone with a wish to boost up
the Falcon will be happy about Ct60 and I hope anyone with a desire to
run TOS programs on foreign hardware will find projects like aranym
useful. And of course it would be nice to see a new clone based on
Coldfire CPU also! There are many projects that are worth appreciation,
although they are filling completely different needs, for completely
different ppl.

All these projects deserve appeciation I think.

> I didnt see so flappy and wide description of a word "fan" as i see

Please, you just can't be serious about that, can you?
Who get bashed for having a true Atari in here??
Anyway, the description of "fan" might better be kept wide, otherwise
we are close to start bashing anyone who is running programs on
anything but a "real" atari...

Yup, Medusa is top notch at customer service, even to the US.
Anyone who failed to get a Hades in the US, and has some excuse
about mail order has simply a lame excuse. Medusa also answered all
my technical questions.

I dl'd it off the web, it is the one from CodeHead. It is coded in
GFA-Basic (yes the CodeHead's did not code everything in asm!) and perhaps
Gokmase should track them dowm and request the source. <hint> <hint>

When the CodeHead BBS was still up John actually told me it was coded in
GFA-Basic.

Humm... benchs. You cannot compare this amiga 060(-PPC) accelerator card
with the CT60 like you cannot compare a CT1 to a CT2. The bandwitch on
the CT60 is 10 times faster than the Hades 060. There are no 060 on the
world who use SDRAM ! The data cache on the 060 is 8KB not 256KB.

Sure you cannot encode in real time a DivX on the CT60, but I think it's
possible to obtain 2-4 frames/s (Aniplayer can encode DivX3/4 now ;-))

Regards,

Didier.

>placed on the machine.

Good for you!! So tell me how many of those other 132 prospective customers
have bought these goodies in the past? If they didn't they'll have to be
content with the Eclipse card (including the crappy driver).

>SCSI sucks (~1.8mb/sec) on the Falcon, unless your using Cubase, why bother?
>Unless you've experienced a Falcon with an Afterburner and NOVA graphics,

Why bother?
What about being able to write CD's at a reasonable speed ? let's say at 8X
without having to go through the trouble of making an image, you must try to
scan a 24bit A4 page at least once to appreciate the advantage of a fast SCSI
interface.

>Unless you've experienced a Falcon with an Afterburner and NOVA graphics, I
>can see where you might "think" there is no advantage. You are surely
>mistaken. As much of an Atari loyalist that I am, I must admit that a

Take away the Nova card and what's left?

>The fact that the CT060 can fit into a standard case with a powersupply
>modification is pretty impressive.

Sure it is.... did I comment on this?

>I have so many Falcon applications, commercial, purchased, boxed and
>manual, that it would take a while to go through the list and detail
>the performance increase seen with an 040 installed. If you have
>anything other than a news reader installed, let me know, and I can do

>some bench marks for you.

Don't bother, I know very well how our software performs on a 040, why do you think I've been singing for years in this group that people should upgrade?

>Inventive? You call a "Desktopper" or a "LightHouse" case inventive?

No, not exactly...

>The best Falcon ST Ram card is made in the US.

Really? So what advantage(s) does it have over the "European rubbish"?

>Wizztronics list is long, but even before them, the most advanced
>accelerator for the Atari was built by Dave Small (SST 030 board),
>whom also developed Magic Sac and Specter GCR.

What have any of these got to do with the Falcon ? Hell, the Spectre GCR doesn't even run on a Falcon...
IIRC the most advanced accellerator board in 1987 was built by a guy named Fredi Aschwanden, it fitted into the MegaST and was build around a 040. I still have the schematics around somewhere.
As for Whizztronics, I remember a graphic card with lousy drivers, a Hades bearing their label etc....

>You must have not been around the Atari market for very long... I have some
>STart Magazines you might like to see....

Again... don't bother. I've got them, they're stashed next to the ST-Log and ST Compute magazines, it's not a very big stack since the magazines vanished after a relatively short time. I also have their predecessors Antic and Analog stashed here... *these* last two were good informative magazines although they focused only on the Atari 8bit. Compared to Antic, that STart magazine from the same publisher is rubbish.
But perhaps I can show you some magazines? my big favourite is the French magazine "ST Magazine", one issue could easily fill-up ten of those STart magazines. Second but very close comes the German "ST-Computer" which is still published today but has lost a lot of his feathers. Third comes "ST-Magazin", another German publication, last but not least there's also the Dutch magazine "Atari Stichting" which must be the longest one running....
If you want to talk magazines go ahead.... last time I counted there were 74 different titles stashed away... did you know that there was even a Belgian magazine around which was sponsored by Atari? After three issues it died a very silent dead....

>>the poor sod asked us where and how he could order a version of CAB !!!
>
>CAB is a pretty poor example. It has lacked support for quite some
>time. It is a product that was taken as far as possible given the
>performance of the platform.

I wasn't commenting on CAB, but on that pitifull dealer with his so called warehouse full of hard and software. Sorry, but when it turns out that this "experienced" dealer doesn't even have a clue how to get in touch with the

biggest remaining software distributor, then I'm ROTFL ...

>Mailorder has always been the nature of the beast when dealing with
>Atari products. I'm sure you didn't have several local dealers to
>choose from even in it prime.

Perhaps this is true for the US. But in Europe the situation was totally different. In a country not much larger then a towel, back in 1989 there were more then 200 dealers.... here in Ghent where I live they were at a given time 7 approved official Atari dealers. In Holland, Germany, Britain and France the situation was even better...

>This is a false statement. Unless I was flat out lied to, which I
>doubt, there were at least two "small time Atari hoods" that were
>attempting to stock Milan boards. The Milan was suppose to be
>available as a "kit", and for whatever reason after their
>introduction, the "kits" were not made available, at least to the two
>who inquired about them. The Atari dealers that existed here in the US
>were the most friendly, reliable people I have delt with. I can only
>think of one developer long ago that acutally burned some people,
>which was back in the 8 bit days. What a pissed off attiuted you have.

So I'm having a pissed off attitude because I'm stating facts?
Whatever the reasons those two "Atari hoods" gave you, the fact remains that they were not able to sell a Milan to you.
Milan had some bad experiences selling the kits to dealers in Europe, some cowboys managed to fill a tower case full of inferior crap and sell it for lots of money. This didn't do the Milan reputation much good, so they decided to assemble the computers themselves. The kit wasn't supplied to dealers anymore, this is common knowledge and those two "Atari hoods" must have been aware of this also. Importing a complete assembled Milan to the US probably would have been to expensive....
Milan sold the remaining kits to us, the normal Atari users, one could order them on their website. They were priced roughly at $450 a piece.

>When the news of the Milan was released, I doubt they had to go anywhere to
>promote their product. I don't know what the reason was for it's low
>production.

You don't know? *INTEREST*.... when there's no demand there's no production, AFAIK some 1000 Milans have been shipped. Meaning that 1000 people took the plunge and bought a faster and far better Atari, 1000 may not seem a lot but compared to those 133 CT-60 customers it's a hell of a lot....

>My only statement in the original post was that 133 orders seems
>low compaired to the number of times that users have wished for a
>faster machine.

And my reply was that 133 orders is quite impressive. It's about time you start to realise that there's no market for faster Atari computers. This is not my opinion but is based on facts. The simple fact that there weren't more then 1000 people interested in a Milan is only one example. The xTOS developers their goal is to reach 500 customers.... In general Atari users

don't want to upgrade to faster computers, it's been shown time and time
again.

>Mr. Czuba has made it pretty easy to order, and considering his past record,
>is a reliable developer.

OK.... you asked for it ;-)
What past record? All I can remember is the Deese card which because of the
lack of software is unusable. If you're referring to what Centek produced then
that's a whole different ballgame. Let's hope that all major software runs
without needing any patches, Mr. Czuba may be a great developer but he's not
so great writing software.

>Yippie Kiayyy, all hardware on this users Falcon is self installed.
>And partner, let me tell you sumthin. If yur Falcun is needin fixin,
>Alex at ATY Computers can fix you right up. Best damn repair in town,
>and makes som hot galdern chile to boot! Tell em mike set ya!@

Once again.... good for you.
I live in Europe, Falcons can be picked up here for very little money, if I
would have a Falcon, which I haven't, and it would need fixing by a qualified
technician, it would be cheaper to but it next to the garbage can and pick up
another one.... ;-)

>Happy Trails,

Always straight ahead.....

Cheers from Belgium
Dennis

<ADVERTISEMENT>
Easiest e-mail client to use...?
Have you tried MJM?
http://gregory.atari.pl/mjm-eng.htm
</ADVERTISEMENT>

This e-mail client is in fact a *very* poor one, but being so simple
in design it is also very simple to use ;-)) if one needs just
the very basic functions.

> Sure it's got it's faults. But what program doesn't? Sure in it's early
> days it wasn't stable, but in it's latest version v0.961, it is now very

I have been using Newsie to read this group for quite a long time
and I must say it isn't really stable having also some annoying bugs
(marking incorrect articles, redraw errors, no "draft" message
option, incorrect window scrolling plus some more minor things).
Pity that the development stopped, because Newsie *could*
became really good when reached the 1.0 version.

> However it is a great example of a multi purpose program. Newsie does News
> and Email like Emailer, but does Emailer do FTP as well? I've never heard

> been popular here in this group.

Why?
Is it because they are commercial?

> But let's put it this way: I've been using ASH Emailer for nearly five years now,
> the database file is 275Mb large and contains nearly 20.000 postings and roughly
> 4.000 mails, I never lost one single posting. I remember playing with crap like

> certain period. They all work fine in the beginning, but once those apps got to
> start managing a lot of files.... it's finito.

There is one bad thing about ASH Emailer (and the main reason I don't
use it myself): it has no support for ISO 8859-2 character set
(where the Polish national characters are located). And that's a pity... :-(

> IMO a program like Newsie shouldn't be even mentioned here anymore, have you any
> idea how many thousands of postings have been devoted (and still are) to that
> piece of crap? it's crappy apps like Newsie that are partly responsible for

> dismissing it because it's an IConnect client.

I don't agree here. I tried Chatter on TT, and it was soooo teeeerriiiblyyy
slooooowwwww ;-) in screen refreshing that I find FracIRC better for me.
Or maybe I am spoiled by FracIRC speed? BTW "orphaned projects" (or
whatever they are called?) contacted the FracIRC author so maybe the
sources will be released one day?

From: jfhaslam@zetnet.co.uk (James Haslam)
Date: 01 Apr 2002 11:46:53 GMT

Hi James,

>IConnect just doesn't have the clients I need. I need freeware/shareware
>clients too. You just can't get a full set of clients for IConnect without
>spending a lot of money.

So, it's the fact that you have to pay money for a program that puts you off?
I'm not going to comment on this attitude, we've been on that road before and
all that came out of it was a lot of slandering and CSAST receiving a lot of
more posts then ususal.
Let me put it this way: if a freeware/shareware application is available that
is just as good or even better then the commercial counterpart, then I'm not
going to buy it either. If however it's crystal clear that the commercial app
offers more features, is more reliable, interacts with other programs etc...
then I'll buy it. Why use second best if you can get first class?

>>>I agree IConnect clients are the best ones (for me Fiffi which can handle
>>>several ftp sessions, where the ftp servers on the list can have unique
>>>names and descriptions is much better than aFTP which does not have those).
>>>It's the IConnect itself that I don't like...
>
>OK Fiffi is good, but expensive.

Expensive? what do you mean? it's part of CAB... it's free.

>Emailer was probably written by a team of programmers, being a commercial
>release, but Newsie was written by one man, John Rojewski. This makes it a
>bigger achievement than Emailer.

Emailer was written by Sven Kopacz, at the time he wrote it he was a student
trying to make ends meet. Now that he has graduated he has moved on,just like
so many of the talented programmers this platform once used to have. On a blue
monday he presented IConnect and Emailer to ASH, the rest is history. There
never has been a team involved in producing neither IConnect nor Emailer, and
I know this for fact. Version 2.2 was finished and assembled in the back of a
car on a notebook on the way to the Neus Atari messe of 1999, let me assure
you that there wasn't one memeber of ASH in sight. The only client which
needed a team of programmers was our beloved CAB. Without intensive help from
Jurgen Koneckzny, Manfred Lippert, Sven Kopacz, Armin Diedering and probably a
few others we would still be swearing at CAB version 2.0
May I remind you that the best programs on this platform have been written by
teams of programmers, how do you think that programs like Calamus, Papyrus,
Photoline just to name a few saw the light of day? You make it sound just like

commercial software is something to stay away from as far as possible....

>However it is a great example of a multi purpose program. Newsie does News
>and Email like Emailer, but does Emailer do FTP as well? I've never heard
>of it doing that. So therefore Newsie beats Emailer on this point hands
>down.

It seems to me that you've asked the question and provided the answer at the same time....

No, Emailer doesn't do ftp like Newsie. But if it would do ftp like Newsie does is I rather would use Fiffi. Just in case you ask why, here are two reasons, but if you want some more just ask, I've got a couple more up my sleeve. With Fiffi I can access and download/upload from several servers at the same time, when a connection breaks down, I don't have to upload or download the whole shboom all over again, since Fiffi will resume where the connection broke down.... how does Newsie compare to this?

>Why are you against Newsie? It's probably the easiest to use email program
>around, I have a friend who can't cope with more difficult programs (due
>to a learning difficulty) but he copes with Newsie.

Why am I against Newsie ? thanks to this piece of crap I once lost a complete partition, it was also responsible for me loosing a lot of mail and postings. Ask anyone here who used to use Newsie, why they've stopped using it... you don't even have to ask, just take a very good look at the hundreds of postings concerning Newsie from "avid" fans.
Any program no matter how good it is, that messes with any of my partitions and especially my boot partition, is thrown in the garbage can and will remain there, even if newer updates remedy it, I tend never to look back again at it.

The only reason why Newsie got popular is because at the time it was released there wasn't anthing better around (the others were even worser). Luckily we have moved on a lot since then and now there are good and reliable programs available both commercial and freeware which unlike Newsie at very irregular intervals will loose mails and postings. Unless one is very tight on memory there's no advantage using Newsie these days.
Well James, this is my opinion, you don't have to like it nor share it, but you did ask for it....

>Just my tuppenny's worth.

Unfortunately that's not enough to buy a copy of Fiffi :-)

Cheers from Belgium
Dennis

Hi Hallvard,

>That's excellent! I wish you all the best with your production of these.
>Will there be a similar card available later which doesn't use the
>cartridge port, but connects inside the machine etc?

Thanks. I have started on an ISA controller. I think I had the
ET4000 working. I got the monitor syncing to it but the test
picture in VMG-4000 wasn't appearing. Anyway, this ISA
controller should support NEtowrk cards too, as long as I modify
driver to point to different area in memory map (and a few other
minor changes).

>My cartridge port is fully occupied with MIDI related expansion devices.
>I believe I came across a similar interface as you're describing which
>connects to the harddisk (ACSI) port, but there was only a schematic
>available, not a complete PCB layout.

Yes, that was Thomas's first project. I wanted Ethernet on a
Falcon, which doesn't have ACSI port. I approached him about
changing driver/hardware to work from ROM port and things went
on from there :)

>Can't remember on top of my head where I found it, but you've probably
>found it as well.

Elmar Hilgert has/is done the PCB layout for EtherNEA, the ACSI
version. I don't know what has happened to that.

>Will something like this be available from you, or the PCB layout be
>made available for us DIYers?

It's GNU! The source for drivers is open, the hardware is open
too. All the images are available on Thomas's website in the
package, along with that ACSI version you mentioned.

>What kind of installation are you talking about? You're surely not
>referring to the TOS 2.06 desktop?

No, he's not. Accompanying MagiC there is a VT52.PRG and .RSC in
the GEMSYS\GEMDESK folder, which intercepts programs trying to
write directly to the screen and redirects the output into a
window. This is necessary under multitasking to allow programs to
run in parallel and prevent one program from hogging the whole
screen.

It's not needed for single-tasking systems. But VDI-Fix also
corrects some errors of programs that do write directly to the
screen, I believe.

Pop-up ads are annoying, and people deserve to know if a site is
spammy like that, whether it was intentional or not on your part.

If you can't take public criticism, then I suggest that you do not
make websites and then invite others to look. ;)

> Then YOU tell me where to move it, and dont say geocities or tripod or

Indeed. You know that you could get free web accounts on all four
of those places, and spread the data out among them. Ah, the power of
hypertext linking! ;)

>(where the Polish national characters are located). And that's a pity... :-(

A far more serious shortcoming of the ASH Emailer is that it
often produces overlength lines that are difficult to read in OLRs
that don't wrap lines very well. I think the RFCs have a maximum
of 76 chars/line, but the message you were replaying to had far
more... up to 86 when i cluding the quote marks.

I understand that the Emailer's auto-wrap doesn't work properly and
it's better to use manual line-breaks.

Hmm, it is ISA only but do remember that there were some ISA
cards built for 100 megabit. But really, there is no point as
the computer is the limit on the transfer speed. The ROM port
is read only, a trick has to be used to make it a write port as
well. Anyway, with Atari apps being coded so nice and small who
needs such things ;-)

Hi!
1.Do you have an SP/DIF Falcon Digital Interface (F.D.I.).Without one
it doesn't work.You connect the FA-8 to Falcon's DSP Port and the FDI to
the FA-8.
2.These modules were not included in the C.A.F package(like on the
other platforms).They are Disk Protected and must be installed from
the original Floppy Disks!That means :searchin' everywhere...It's
very difficult to find these programs nowadays.Ask Steinberg or
Germany's discussion groups...

No, the logic for the GALS is available, and if it isn't, one could
make it so. The NOVA interface is very simple to build. The
possibility is there for those that would care to duplicate it.
Nothing loss except for a couple of bucks (or pigs or cows, whatever
your economy is:).
>

We are not talking about bringing the Falcon, or any OEM Atari up to
current specifications here, only improving on what is available. Even
on the latest PC's, to burn at 8X is not 100%. Even my new Pentuim
will spit crap up if I try to copy multiple files from all over the
disk and record at 16X.

>

:) A very fast Falcon.

>
> >The best Falcon ST Ram card is made in the US.
>

> Really? So what advantage(s) does it have over the "European rubbish"?

You were the one that started the rubbish crap. The Wizztronics memory card performs flawless at 25Mhz. If you've been around as long as you say, you'll remember all the talk about trash memory cards not functioning on accelerated Falcon a few years ago. I have both the Ram Gizzmo, and Wizztronics cards. Never a problem on any of my 4 (accelerated) Falcons.

> What have any of these got to do with the Falcon ? Hell, the Spectre GCR
> doesn't even run on a Falcon...

Reread your thread. You were discussing Atari developers in general, not just development on the Falcon.

> IIRC the most advanced accellerator board in 1987 was built by a guy named
> Fredi Aschwanden, it fitted into the MegaST and was build around a 040. I
> still have the schematics around somewhere.

Right, some of the early development was only on paper. I know who Fred is.
You could actually purchase an SST Board.

> As for Whizztronics, I remember a graphic card with lousy drivers, a Hades
> bearing their label etc....

I think you need a couple of English Atari magazines. Wizztronics didn't make an FX card, nor was their label ever on a Hades.

> But perhaps I can show you some magazines? my big favourite is the French
> magazine "ST Magazine", one issue could easily fill-up ten of those STart
> magazines. Second but very close comes the German "ST-Computer" which is still

> developers their goal is to reach 500 customers.... In general Atari users
> don't want to upgrade to faster computers, it's been shown time and time
> again.

And I don't dispute that 133 cards isn't impressive, only that more
Atarians have asked for a faster Falcon than the sales numbers
indicate. Here is their chance. That, in a nutshell was my only
feelings in the first post. If ppl are happy with a stock machine,
that's great. If not, then they have better jump in before the sale if
over.

Personally don't like your tone of voice, telling me "it's about time
I realize..." You can shove that right where the sun doesn't shine.
Are you proud of yourself that you can make fun of a person that
probably has a bedroom full of manufacture wrapped software, and calls
it a business. Maybe he sells two or three packages a month. That's
how he enjoys Atari computing. In the US, that is called a home
business, no matter how inefficient he operates. You don't have to be
a genius here to run a business. He seems to have good feedback. He
doesn't need verbal assaults from some self-proclaimed loudmouth, even
if his post are sometimes unorthodox.

I realize the status of the Atari market. It's a niche hobby market.
Surely, I was thinking, that there must be at least a few hundred
Falcon users that would like the upgrade, the last stepping-stone for
the Falcon that will likely be available. The Falcon has at least some
software base. Even if a PPC is adapted to the machine, likely none of
the Falcon specific software will work.
Those were only my thoughts, they are not for you to change. I will be
the judge of that.
Enjoy your beef,
Mike

I actually do that on my Hades060 without images, audio CD's to be exact and
it is a SCSI cdrom burner. On top of that the hades has the same slower
SCSI bus as the original TT yet 8x burning works. If the ct60 has more
bandwidth than a hades as I keep hearing it should be able to do 8x as well,
the falcon is actually scsi 2 if I recall correctly. Anyway I do not wish
to argue or debate really, just stating my opinion that I think the ct60
will perform well if it works as advertised.

2833. HighWire 0.03 released!

Newsgroup: comp.sys.atari.st
Date: 2002-04-02 01:55:42 UTC
From: RobM <rmahlert@charter.net>
Message-ID: <uai3hr58flrk28@corp.supernews.com>
Source record: 36388

The HighWire Development Team has released the third demonstration package. Progress has been made and there are many more exciting things coming in the near future. Finding a point to release this time around has been very hard. Almost daily, some new support has been added or some old bug found and exterminated.

Improvements have been made throughout the code. Tables support is looking brilliant, frameset support has been improved again. Some irritating font issues have been fixed. Upper range character display improvements. Atari character display in text files. More 'common' buggy html code is supported. Yes many 'popular' sites have html that doesn't comply with the specs ;) And that is only a portion of the improvements.

As always, we hope that this release will silence some of the detractors who have been saying our task is impossible. Our goal is achievable, it will just take time and your support. We can always use more programmers and support on the documentation side of the project always is a critical need. Translation support for more languages would be a great addition to the project as well.

We do feel that we have something here that shows that our platforms need for an open source browser can be obtained. Currently it should not really be classified as a browser, but more of a demonstration of a parsing and rendering engine. This technology is open source, so hopefully with your support it can be the core to many projects on our platform. Not the least of which will be in the future a fully modern web browser. To reach that goal we will need time and the help of community.

HighWire Development Team

Source record: 36389

Dennis,

What kind of CRACK are you smoking? iConnect is alright, I'll admit. The apps are very pertty, and with larger amounts of data might work better. I won't dispute that. I also wont' dispute that most of the STiK apps are non-commercial and have most of the problems associated with that fact. But. I feel a falcon, a weird one like mine at that, is a good test machine to show which ipstack performs the best. On a faster machine, the difference might be negligable but let's face it. On a 4 meg machine, iConnect and his friends are unusable. They simply suck up too much RAM. I dismissed them entirely until I purchased my Falcon. Upon trying them out on my falcon, I was immediately disappointed. The PPP worked poorly and the SLIP support worked not at all. STiNG and MiNTnet provide excellent transfer speeds over 115200 serial on my Falcon, there's tons of applications and ALL IMPORTANT publically documented programming API's. I can develop software for STiNG and MiNTnet. I don't have the faintest clue about iConnect.

Let's talk about teli and chatter? chatter crashed my system instantaneously, I was never even able to experience it. AtarIRC is hands down the best client, but that could be arguable if FracIRC still worked on newer versions of MagiC... Guess I have another coding missing eh?

And teli? Yeah, it's BEAUTIFUL to have a telnet client with full ansi support for something like bitchx. Telstar and telvt are both crappy, but Teli is SO SO SO SO utterly and pathetically slow that it is unusable in full 16 color mode. In my opinion this is COMPLETELY unacceptable after seeing what ConNect can do, and after all, teli is just a telnet client.

In the land of atari, things tend to win based on quality over anything else. This isn't a normal PC world. The fact that STiNG and ESPECIALLY mintnet are used is a testament to their quality. Nothing to date beats BSD style networking and I highly doubt anything will for a long time, even a pretty stack like iConnect.

If you're wondering why I have a somewhat mean tone, I feel a bit preturbed by some of your other posts. I apologize in advance for any negative tones, and really don't want to hear it back.

oh, and iFusion doesn't work well either, so much for that. Laughable speed, extreme latency using something like telstar and low overall bandwidth to boot. If I can tune the settings, that's great, but I really don't feel like doing that for a product I have to buy. Commercial software is supposed to work, yet most of the time it doesn't.

/me breathes,

Maybe after my post to Dennis I should be telling myself to calm down.
Things do seem a bit tense these days. I think everyone is nervous about
how well certain things will perform or maybe people are thinking the
coming days are the Armegeddon of Atari. Who knows ;-). At any rate, if I
posted anything offense to anyone, I withdrawl it completely and hope to be
a happy go lucky atari owner like SWE here..

Cheers

Generally these are call "bombs", and three is a fairly basic error. Their
exact significance was discussed recently on here so a visit to
groups.google.com
to search the archives may well result in further enlightenment.

No I can't !!!!!! remember what three mean :-)

>
> So my question is the STe compatible with STf software????
>

Generally "yes", but as the STE has slightly different hardware and software
there are some programs which just don't work. Some like Tynesoft "Winter
Olymics"
can be fixed as they use an autoboot program which fails under TOS 1.6. You
can
just set the system to autoboot the ".prg" file.

Other fail because make asumptions that are no longer valid, I think that
for
example some games used hard coded direct calls to TOS and as TOS1.6
has its routines in different places to TOS 1.4 etc these now fail.

> Or is there something I need to do to make the STe run in the old STf
mode??
>

You could try using the TOS from your STf but at best that will disable some
of the STE
features and only make some games work. At worst it won't even boot....

I also think there is also a disk version of TOS 1.2 floating around
somewhere on the net that might
help.

On my old 4MB Atari STfm running STiK under Single TOS I have been a user
of Newsie for a long time. I used it for email, ftp, and news, and it
worked pretty good.

Now, on my Falcon030-CT2b with plenty of RAM, running MiNT/MiNTnet I have
many alternatives for NEWSie that are much more stable and powerful.
(aFTP, aMail, MyMail, and stuff like pine, mutt, and lynx). On this setup
Newsie crashes all the time, and I hardly ever use it anymore nowadays.

Martin

For example, when I tried downloading the recent version of Highwire
http://highwire.atari-users.net/ -> Download -> Binary it turned
out that IConnect CAB OVL cannot do it ("File not found"). But
STiNG CAB.OVL worked OK.

>anyway. I guess the real question is: Would the drivers work with a
>100mb card...
>
>So, it SHOULD work if the card is NE2000 compatable, right?

Yes, I would think. Perhaps Dr Thomas Redelberger would know,
he wrote the drivers. They were taken from the Linux drivers and
heavily modified and optimised, we're taking assembler here!

Not anymore - 100MBit/s-only hubs have nearly disappeared, and 10/100MBit/s switches are getting nearly as cheap as 10/100 dual-speed hubs.

>Yes, I would think. Perhaps Dr Thomas Redelberger would know,
>he wrote the drivers. They were taken from the Linux drivers and
>heavily modified and optimised, we're taking assembler here!

The only 100MBit/s ISA card I know is the 3COM 3C515 - still quite expensive, but on a PC, it will at least get more throughput than a 10Mbps card (IIRC, ~2.5MB/s real throughput via TCP), although the ISA bus severely limits it.

There is one 100MBit/s NE-2000 compatible chip from a taiwanese company, but I have never seen that used on an ISA card. 100MBit/s usually means PCI (and not NE2000 compatible from the driver side).

AtariICQ 1.54 will run with IFusion and an IConnect connection BTW.

>BTW: anyone who maintains a website should really use Fifi or at least give
>it the benefit of doubt, there's a very nice GEMscript available for Fiffi
>which turns the tedious task of updating and/or maintaining websites as
>simple as a mouseclick....

Fiffi crashes out if you try and drag a folder to the ftp server IME :-(

That script you mention isn't really complete enough to use as an automatic
updater as it really needs code adding to it to recursively check the contents
of a given folder to upload anything with the archive bit set, and to clear it
once uploaded.

Not too impressed by "Chatter" myself either. It wants to put its config files
and logs in whatever destination takes its fancy. As for the window opening
bug...

It's got to be better than AtariIRC though, which I've deleted from my hard
drive permanently. Why the author decided that he'd rather lock up the
computer if certain specs weren't met instead of gracefully exiting I will
never know.

I have a number of first word files on TOS formatted diskettes, but I no longer have an ST. I'm now using an iMac running OS 9.2. I'd like to read those files (as well as some paint files - I'd be happy with just First Word) on my iMac.

It would be great if I could access an ST (format some PC diskettes and write out all the files as straight text), but I don't. Unless there's an ST user out here in the Philippines!

DUST appears to create disk files for use only on emulators. As many of you know, the mac just won't read the TOS diskettes properly. I've seen some shareware out there with a .lzh extension that might do the trick - but I have no idea how to decompress/compile these .lzh downloads.

Help!

Martin

I can't see how. A network is by far the most convenient option, atleast
if he don't run Atari-apps on his Mac.

A bit late here, but anyway... I think you'll see that the IConnect OVL is
younger than both the STiK- and MiNTnet-OVL.

In the case of IConnect then it's crystal clear (atleast to me) that both
STiNG and MiNTnet are better choices. Simply because IConnect does not
work with anything else than dialup connections, and thus is completely
useless to me as I've had ADSL for a long time now.

This effectively also makes all IConnect-only clients useless, since the
IConnect API isn't public and therefore can't be implemented on top of
STiNG or MiNTnet.

Internet Connection Sharing has nothing to do with SMB. ICS is pretty much
the same as IP-masquerading under STiNG or MiNTnet.

Hello.

Both Lyndon and Hallvard have remarked about chopping the ST mobo to fit in a rack case.

> Hmm, mines coming on nicely. Soon photos on my site. Best fun
> was sawing 1cm of the motherboard! ;-)

> Yeah, that's what I'll have to do with my STe as well.

This is pointless butchery.

My 19", 2-4U rack case will take both the ST and Falcon mobos without resorting to this mutilation.

I'm clearing the last few out bare for £25 sterling plus carriage.

Mega STE keyboards for £10 sterling plus post.

Barrie at Keychange.

Find a friend with a PC, load an ST emulator which allows you to read ST floppies and also use the PC HD (no, I don't remember which one had that capability, but there is one at least, I'm sure).

Then if the PC has a CD Burner, burn the files and read the CD on the Mac. If no CD burner available, connect through the Internet to your iDisk (part of Apple's free iTools; if you didn't activate it yet, this is the right moment) and drop the files there. Then go to your Mac and retrieve them from iDisk in the same way.

Good luck!

Nick.-

Hi there!

Would someone with some more technical experience take a look at this product and give me their opinion of whether or not it would work for connecting an iMac to a Falcon through the iMac's Ethernet port and Falcon's LAN port? Maybe using STiNG or MagXNet's networking capabilities? Thanks!

URL (hope it comes out correctly, if not, let me know!):

Yeah, but when I bought MY 100 Hub, a 10/100 was significantly more
expensive.

> The only 100MBit/s ISA card I know is the 3COM 3C515 - still quite
> expensive, but on a PC, it will at least get more throughput than a 10Mbps

I believe that's the exact card I have: The 3C515. Yes, very expensive.
But I didn't have a choice at the time! I needed a 100mb ISA card!

> There is one 100MBit/s NE-2000 compatible chip from a taiwanese company, but

Seems silly that someone couldn't write a NE2000 compatabable driver for
ANY card. I mean, what with all the emulators and such these days.

Back in the days when Newsie was a frequent subject of discussion here,
I got an impression that Single TOS is the ONLY environment where it
runs fine- and then it indeed runs very fine. So I think that it is
still an optimum solution for someone with a simple setup (i.e. small
RAM, Single TOS, etc.).

Btw. as can be see, I am (still) using Newsie (V0.961) and it does not make
any particular problems. A lot of earlier bugs has been remedied. FTP
works (this has always worked for me without any special measures taken,
I don't understand the problems people had), e-mail works, news work, and
it is all-in one. Web browser is rudimentary and not really usable, but it
is understood that this has never been finished.

Concerning disk corruption, I noticed that if Newsie has to be crashed
for some reason (by user action or by Sting hanging because of something,
which I had to do several times), then Newsie does not close its log file
properly, which indeed results in a lost cluster on the disk. This lost
cluster can be viewed with e.g. Diamond Edge to contain the text of a log
file. But if Newsie exits in a regular way, everything remains ok with
the disk.

Indeed. At the place where I work we needed to buy a couple of hubs
and finished with 10/100Mbit switches instead, because the price was
practically identical. Now we are very pleased that we bought the
switches- we substituted one of the older 10Mbit hubs we had as well
and the difference in performance was very noticeable in this case.

> just First Word) on my iMac.

A lot depends on precisely how the floppies were formatted. AFAIK,
MacOS 8.x (and presumably 9.x) won't do too well with disks formatted
using the standard ST formatting tools, but MacOS *DOES* have the
capability to read FAT floppies, and at least some ST formatting tools
do create compatible floppies. (I don't have any names handy, I'm
afraid.) I just checked, and was able to mount some of my ST floppies
(as disk images) in MacOS 8.6, but others didn't work.

If you want to try reading the disks directly, the question becomes one
of how to get the ST disk hardware read on an iMac, which has no floppy
drive. One possibility would be to buy or borrow an external
USB-interfaced floppy drive or an LS-120 drive. These should be able to
handle the low-level ST disk format, turning it into a question of the
compatibility of the ST's FAT format with the MacOS FAT drivers.
Another option would be to copy the disk to an image file and transfer
it to the iMac in any convenient way, like on a Zip disk, via an
Ethernet network, etc. If you have access to a Linux box, you can use
the standard Linux dd utility to do this:

dd if=/dev/fd0 of=st-disk-image.img

You may then need to deal with MacOS type and creator codes to get it to
recognize the image as a disk image file. I'm sure there are tools
that'll do this job under DOS or Windows, too, but I don't happen to
know what they are.

If you think it's likely that the FAT format isn't MacOS-compatible,
the question becomes one of getting individual files off of the
floppies. You can then transfer them as files, via Ethernet, on a Zip
disk (the iMac can read DOS/Windows FAT Zip disks), etc. As with MacOS
compatibility with ST FAT floppies, Windows compatibility is uncertain.
It's worth trying to read your disks on a Windows system, though. When
I tried just now, I had more success with Windows than with MacOS, but
my success rate was still not 100%. Similarly with Linux (but Linux and
Windows could read different sets of ST disks, so of the three I just
tried, one could be read only in Linux, one only in Windows, and one in
both OSs). If you can't seem to get the files off the disks using

standard disk handling in whatever OS you're running, you could try an ST emulator. Set it up to copy files to your hard disk, or format a floppy with Windows beforehand and copy files to it.

I have my Hades060 and iMAC talking to each other now via a D-Link DI-704
Cable/DSL Internet Gateway. They also share the same cable mode access
so I do not have to use the iMAC in order to have the Hades online.
I'm quite happy with it.

I looked at your link but I am not sure what that item does exactly.
Not sure what is meant by "localtalk".

My setup is MiNT-Net, however I wrote a doc on how to go about it.
The doc is aimed at Hades/Milan users with MiNT-Net but maybe some of
it might be helpful? If you wish to read it let me know.

2869. Ethernet/Sting/MagicNet/Mintnet

Newsgroup: comp.sys.atari.st
Date: 2002-04-03 01:01:14 UTC
From: Brian Van Tilborg <madmax@bfree.on.ca>
Message-ID: <1017792822-874039AEicMi@bfree.on.ca>
Source record: 36266

Ok, I am all pumped regarding the ethernet solution. I have a few questions.

1) Is this solution relatively fast? A benchmark I can understand would be nice.

2) I want to hook up a number of my Ataris, however, they are all running different OS.

2a) My Falcon just isn't Magic Friendly for whatever reason. And I haven't installed Mint or Mintnet, but run Geneva or Straight TOS and STing.

2b) My TT Runs mainly Magic 4.0 and Sting or PPP Iconnect. I want to run Magicnet, however, one of the instructions suggests that the OS handle long file names. Is this absolutely required? I am lazy and really don't want to update to a newer version of Magic.

2c) I use some Standard STs with 2.5 to 4 meg of ram, however, even with Magic/Nvdi running some programs eats up the memory fast, so sometimes I run Single Tos and Sting. So.....

Can I network, Atari Computers running STING and MagicNet, together, and/or include Magicnet and Mintnet driven computers in the network? As I may get another TT with Mint on it?

In a worst Case Scenario, I know I can network Sting, but I am very much aware that Mintnet and Magicnet are much faster and possibly more reliable.

Also, is the PPP/Iconnect solution pretty much isolated with regards to network solutions? Am I stuck with this as a solitary dialup solution?

The reason I am saying this, is that currently my home doesn't have and won't have Cable access. Therefore the ethernet solution be used only for the local network.

I believe both Sting and Mintnet, (probably magicnet too) have masking and remote dialing, unlike Icconnect.

And now for something completely silly.

There are network hubs that have Ethernet and (DSL?) High speed phone access, combined in one unit. I don't know if these are independent or what.

Can I hook up an ethernet solution to this Hub

(1) can I do this at all,

(2) If I can do this, is their a possibility for the High Speed Phoneline access. As this is a possibility in my area.

I am looking for an "Atari" solution, however, perhaps I may have to buy a Windows driven computer and use it for the High Speed Internet connection.

Well, hope I don't sound to stupid,

I look forward to any answers.

Brian.

2870. Any Atari ST Hard Drive emulators?

I had another site (which I've lost and can't find) where the device was
explained a little better. I'll have to find that for you. It is a
Ethernet-to-RS422 LocalTalk adapter, letting Ethernet-based Macs (like the
iMac) network through its Ethernet port to RS422-based devices (printers,
modems, other [Mac] computers, etc). I assume it uses the standard Mac
LocalTalk/AppleTalk protocols, but as I don't know exactly what that entails
or means for Falcons, I can't help you there. I was thinking, if I could
find one of these things locally, I can see if they will let me purchase it,
try it out, and return it if it doesn't work. I just thought I'd ask here
first, in case anyone has any technical advice or cautions about trying such
a device.

My only other option that I can see would be to get a ROM-port ethernet
adapter. There's a problem with that, however. I have recased my Falcon, and
it is set up in such a way that I can't easily reach the ROM-port. I use
Cubase Audio pretty often, which requires its ROM-port dongle. So I would
have to constantly be pulling apart the computer each time I want to switch
between the two. Not a fun job. Unless Mario Becroft is still intent on his
SCSI Ethernet adapter, there's nothing else I can use (that I can see - any
advice to the contrary, I'd gladly welcome!).

If that device requires the appletalk protocol it won't work. As far as I know nothing on the Atari implements that protocol.

I have similar problems with my TT. So it's not wired at this time.
A SCSI option would be nice.

Want to sell your cable ? You need to have a multisync monitor to auto
adapt to the specs for Atari.
Thanks

Hallo Jo Even!

JES>This effectively also makes all IConnect-only clients useless, since
JES>the IConnect API isn't public and therefore can't be implemented on
JES>top of STiNG or MiNTnet.

That's not true, as it has been implemented for MagiCNet (and MiNT-Net). It's
not publicly avaailable yet, but it's working.

Heh!

I'm sorry for the laughing, I don't want to make you feel silly, but that's silly ;-). No, instead there's SCSI and IDE interfaces for the Atari. In theory an emulator for a PC is something that is possible but never has been done. And it would be rather expensive and still require a PC! ;-)

Instead you can look to I believe atari-workshop in the UK for a Link97 scsi adapter or now, you can even get an IDE interface for your atari from Mario Becroft (search his name on google).

Once you've got one of these you can most likely pick a hard drive off the store shelf to pop in. It would be much cheaper to go this route than partaking in an ACSI to uhmmm uhhmmm..

the only port on the PC that would be fast enough is the scsi port, and well you could just use a Link97 to convert your atari's ACSI hard drive port to scsi... ;-)

Hope I helped

Mike,

You could do it but it would be no different than how I provide internet to my falcon and TT. Localtalk is nothing more (it's actually less) then simple serial ports found on any PC or mac.

Unfortunately you won't get much faster speeds out of localtalk then a serial port too. I'd say 38400 on a normal STe or 115200 on a TT or Falcon. Can result in a total speed between 5-10Kbytes per second. Most people are looking to solutions that provide ethernet access directly to the atari resulting in speeds in excess of 70kbytes/second. Localtalk isnt' very fast even though it's called the LAN port.

Hope I helped
Thanks

True, but it is much better than any other alternative I've found. And a
115200 bps rate direct connection for file transfers between the two systems
sure beats my current methods: either e-mailing them to myself from one
computer, then retrieving the e-mail again with the other computer, or
FTP-ing it to my web site, then downloading it again. Mind you, this is with
a 31200 bps connection on my Falcon, and a 49333 bps connection on my Mac,
much slower than 115200. And there's the whole
log-on/e-mail/log-off/log-on/retrieve/log-off process. I'll take the
LocalTalk, thanks! :)

On another site I found today, it said the device doesn't specifically need
AppleTalk protocols, just any LocalTalk equipped device. There was one
problem I noted. It said it didn't send IP packets, so it wouldn't be able
to work with TCP/IP. I'm not sure what it would work with, exactly, but... I
sent an e-mail to the company explaining the details of what I'd like to do,
asking if their product would work in my case, and if they have any other
advice. We'll see what happens (if they don't just laugh at the mention of
"Atari Falcon" and hit delete).

Try to find the 3D demo that was presented at the "Forum Atari" in
Paris around 1990, made by Zarathoustra (Pascal de France) and M-Coder
(Jean Charles Merignac).
It's in 640x480 256 colors, real time (can move the objects using the mouse)
and totaly kick ass.

With Magxnet installed one can use its ported version of GlueSTiK and a Draconis gateway, and hopefully the IConnect gateway will come out of beta soon. Then you will be able to use all (major) clients no matter what they might be. Not sure how cable modems or ADSL come into the picture however.

With a suitable host adaptor (I think the Link 97) on the Atari and using
HDDriver I'm pretty sure that it's possible to share a _SCSI_ drive between
the PC and Atari.

Otherwise it'll be a case of using one of the utility programs such as
Ghostlink or PARCP to connect the two computers together, not as transparent
as the shared drive idea though.

2886. XaAES v0.943

Newsgroup: comp.sys.atari.st
Date: 2002-04-03 11:59:01 UTC
From: Henk Robbers <h.robbers@chello.nl>
Message-ID: <3CAAEE0F.C4FAD3B3@chello.nl>
Source record: 36333

LS

There is a new version available on my homepage.

1
Most important fix:
rsrc_gaddr() for R_FSTRING and R_FRIMG.
The index was not added to the start address.

This fixes 3D_CALC, CDISO and probably many others.

2
Second important change:
!!!
Split up the config file in 2 parts
The first is needed for initializing XaAES.
The second needs a fully initialized XaAES.

The first replaces xaaes.cnf and is now called xa_setup.scl.
The second is new and is called xa_exec.scl

All executorial commands go to xa_exec.scl.
Currently these are:
open
run
desk
shell

xa_exec.scl is executed immediately befor entering the main kernel loop,
but prior to the release of the semaphores.

The change solves a lot of severe and dangerous entanglements while
processing the single xaaes.cnf.

The debug version of xa_setup.scl is called xa_debug.scl

If xa_....scl do not yet exist, xaaes.cnf and xaaesdbg.cnf are used
and processed as before.
But this will disappear soon. It is only maintained during transition time.
!!!!!!!!!!!!!!!!!!!

4
Before XaAES leaves, the bios curser is enabled and set to the home position.

5
Fix to prevents shel_find from accessing the floppy drive when XaAES tries
to find its files.

6
'debugpoint all' is the same as 'debug all'.

7
Implemented wind_get(-1, WF_TOP, apid) MagiC 4
Put apid in front.

8
Implemented wind_set(hdl, WF_ICONIFY, -1,-1,-1,-1) MagiC 4
Iconify to next free position.
Also a closed window can be iconified and uniconified.
Papyrus uses this form of iconify.

9
wind_get(..., WF_DCOLOR, ..., &flgs3D) MagiC 4
flgs3D := 0x0f0f

10
appl_control:
If APC_TOP is issued on a accessory, AC_OPEN is sent to that acc.

11
A ancillary program named XaNNaX
Read the readme in the folder XANNAX

12
wind_get:
Clear arguments of wind_get when invalid window handle is passed.
This prevents FIRST/NEXTXYWH loops from looping forever.
Fixes such a loop in CDISO.PRG when selecting a option from the menu.

13
Fixed a bug in export command.
the string:
avserver="THING "
was incorrectly interpreted.

where
avserver "THING "
and
avserver = "THING "
were OK.

14
Moved all the standard headers used by the current XaAES to the folder
xinclude in the xaaes source folder itself, and use them from there.
This gives a clear overview of the headers used by XaAES.
It also makes it perfectly clear which version and which brand of headers

are currently suited to get XaAES compiled at all.

If someone has more recent header files and want to use them, if it fails
there is at least a set of headers to which the more recent can be compared.
So the cause of the compilation failure can be determined unambiguously.

Have fun!

there was a program called ghost link which did this, but not through the
DMA port, but by the serial or printer port. Ive got it on disk somewhere.

serial is slower than a floppy drive so defeats the purpose.

Exactly the clearance width of an ST mobo.

> Could I squeeze a Mega STE motherboard in there?

No. The case just takes an ST mobo.
It is necessary to 'spring' the rackmounts to get the case in but once in
everthing is OK.

To put a Mega STE or TT in a rack use a rack shelf and velcro the Atari onto
it from the back.

Date: 2002-04-03 16:05:25 UTC
From: bm827@FreeNet.Carleton.CA
Message-ID: <a8f985rga1@freenet9.carleton.ca>
Source record: 36338

I adapted a MonitorMaster to provide VGA out and here are some of
my observations:

NEC 3A's and NEC 3D's (Multisyncs) will show all three resolutions;

NEC 2D's will only show HI (mono) resolution;

most VGA monitors will show only HI (mono) resolution.

I don't know how the Best Electronics cable works. If it has a switch
for HI (mono), it may work with a desktop VGA monitor or with your
VGA TV. There is little or no chance it will provide LOW or MEDIUM
res unless your VGA multisyncs.

There is a file to describe how to make your own MONO res cable, if
your present cable doesn't provide this feature. In essence, it grounds
one pin (to indicate MONO to your ST) and ties the three colour outputs
into one signal to provide mono = hi resolution.

IMHO, however, nothing beats the crisp quality of a real Atari monitor,
particularly in HI res.

Hi Mike,

>I realize the status of the Atari market. It's a niche hobby market.
>Surely, I was thinking, that there must be at least a few hundred
>Falcon users that would like the upgrade, the last stepping-stone for
>the Falcon that will likely be available. The Falcon has at least some
>software base. Even if a PPC is adapted to the machine, likely none of
>the Falcon specific software will work.

I agree, but like I said there's nothing new under the sun. Atari users have a long track record of not wanting to upgrade their computers. This attitude was partly responsible for Atari going under, initially when the Falcon was first released Atari hoped that a large portion of the userbase would take the jump and upgrade, unfortunately most didn't and sticked to their trusty ST/STE. Can you imagine Mac or PC users doing the same thing? Atari constantly had to try to find new customers because the existing base was happy with their previous products.

All that time and energy waisted for only a measly 133 cards, I bet that the developer of the CT-60 envisioned it quite differently... can you imagine how the moral of the Tempest developers must be right now? their prospective card targets the very same users, it went unnoticed in this group, but a couple of weeks ago it was officially announced that the DesTTiny card for the TT would not be produced meaning that the potential market for the Tempest is now even smaller.

>And I don't dispute that 133 cards isn't impressive, only that more
>Atarians have asked for a faster Falcon than the sales numbers
>indicate. Here is their chance. That, in a nutshell was my only
>feelings in the first post.

I think the CT-60 has arrived to late. A lot of Atarians who wanted/needed a faster Atari bought a Hades or Milan. And then there's the enormous number of people to consider who migrated to the PC or Mac and do whatever it is they are doing with an emulator. Last but not least there's also the group who's working with a AB40 or CT2 card. These people are probably quite happy with what they've got and have no real reason to upgrade to a CT-60.

>If ppl are happy with a stock machine, that's great. If not, then they have
>better jump in before the sale if over.

That's probably what's going to happen. There was a time that Nova cards, TT-Magnum RAM cards, network cards etc... could be bought right from the shelves, only a small fraction of the targeted users bought them. But now that these

products are out of stock and out of production everyone wants them... the result is that small fortunes are being payed for these expansions now, so to conclude, a CT-60 is a nice investment, in a couple of years from now it will be worth at least twice as much.

>Those were only my thoughts, they are not for you to change. I will be
>the judge of that.

It seems to me that we're tuned to the same channnel, but have a different way of broadcasting the same message :-)

Cheers from Belgium
Dennis

Hi Peter,

>A far more serious shortcoming of the ASH Emailer is that it often produces
>overlength lines that are difficult to read in OLRs that don't wrap lines
>very well.

It's not a shortcoming of ASH Emailer but of the user, although I admit it is
more or less confusing. In the menu "Options" one can set the maximum length
for mails and/or postings. These settings however have nothing to do with the
way a mail or posting will be sent. The settings apply to the way the mail is
displayed on the screen.

>I understand that the Emailer's auto-wrap doesn't work properly and
>it's better to use manual line-breaks.

There's nothing wrong with the auto-wrap, it's completely up to the user, if I
would set my screen to for example 160 characters, then you would get mails
that are perfectly auto-wrapped between the 155th and 160th character. More
and people are working in higher resolutions, and they tend to use a larger
window because it more comfortable reading mails that way. Unfortunately they
sometimes forget to limit the size of the window to 80 chars. and the result
is that Emailer produces a overlong posting/mail.
Much of these "faults" are due to ASH Emailer only being available in German,
although DDP translated the program there's no English manual, so the user has
to learn the ins and outs of the program by trial and error....

Cheers from Belgium

Hi Mark,

>What kind of CRACK are you smoking? iConnect is alright, I'll admit. The
>apps are very pertty, and with larger amounts of data might work better. I
>won't dispute that. I also wont' dispute that most of the STiK apps are
>non-commercial and have most of the problems associated with that fact.

So what exactly are you trying to dispute? the fact that I'm smoking crack?
You should give it a try, it broadens ones mind...

>But. I feel a falcon, a weird one like mine at that, is a good test
>machine to show which ipstack performs the best. On a faster machine, the
>difference might be negligable but let's face it. On a 4 meg machine,
>iConnect and his friends are unusable. They simply suck up too much RAM.
>I dismissed them entirely until I purchased my Falcon.

An average installation of Magic, Jinnee and NVDI will use up something like
2Mb, which leaves you with roughly 1.5Mb free RAM.... are you trying to tell
me that 1.5Mb isn't enough to do your thing? The only client which might use
up that precious memory completely is CAB, and that's not a stack related
issue. Tinkering a little with the cache settings will remedy this.

>Upon trying them out on my falcon, I was immediately disappointed. The PPP
>worked poorly and the SLIP support worked not at all.
>Let's talk about teli and chatter? chatter crashed my system
>instantaneously, I was never even able to experience it. AtarIRC is hands
>down the best client, but that could be arguable if FracIRC still worked on
>newer versions of MagiC... Guess I have another coding missing eh?

Oh boy, some guys have all the luck!! IConnect's PPP working poorly, SLIP not
working at all and then the icing on the cake is Chatter crashing. Hell, even
FracIRC doesn't work anymore... Has it ever occured to you that maybe perhaps
something isn't set up the way it should be?
For your information FracIRC works very well under MagiC 6.20

>And teli? Yeah, it's BEAUTIFUL to have a telnet client with full ansi
>support for something like bitchx. Telstar and telvt are both crappy, but
>Teli is SO SO SO SO utterly and pathetically slow that it is unusable in
>full 16 color mode.

Oh, but that's easily fixed.... treat yourself to a CT-60 :-)

>If you're wondering why I have a somewhat mean tone, I feel a bit preturbed
>by some of your other posts.

Do you really? Just hang in there, I'm only warming myself up, it's been a long cold winter... I've kept my trap shut for a couple of months, but after seeing all the garbage and nonsense that have been posted here lately I just couldn't resist the temptation anymore.

>oh, and iFusion doesn't work well either, so much for that.

So what's new?

>Commercial software is supposed to work, yet most of the time it doesn't.

You've just won the first prize for the statement of the year!!!

>http://highwire.atari-users.net/ -> Download -> Binary it turned
>out that IConnect CAB OVL cannot do it ("File not found"). But
>STiNG CAB.OVL worked OK.

Now that is funny....
Until today I never had a problem accessing that site, downloading the files
is just a matter of a mouseclick. what makes it even funnier is that a couple
of months ago I mailed version .02 to several people which weren't able to
download it themselves.
You are using the latest version of IConnect and CAB.OVL I hope?

PS: a screenshot of IConnect running CAB downloading the above mentioned file
is now in your mailbox.....

>STiNG and MiNTnet are better choices. Simply because IConnect does not
>work with anything else than dialup connections, and thus is completely
>useless to me as I've had ADSL for a long time now.

True... (I actually agree with you for once!!)
But this thread has taken a wrong turn somewhere. I originally replied to Mike who couldn't get a proper connection with STiNG and adviced him to try it with IConnect.... in my experience IConnect is nearly foolproof, if one can't get a connection using IConnect then the chances of that person succeeding with a different stack are minimal.

>>>OK Fiffi is good, but expensive.
>
>> Expensive? what do you mean? it's part of CAB... it's free.
>
>Is CAB free?

No ofcourse it isn't, but some people here think it should be...
Anyway Fiffi, IConnect and Telnet are part the CAB package, I realise that there are a couple of Wensuite users among us and that there might even be a Draconis user lurking around the corner somewhere. But it's probably safe to assume that 95% of the Atari users use CAB to surf on the internet, so for 95% of these people using Fiffi costs nothing, they don't have to fork out any extra money since they've already got it.

Cheers from Belgium

Hi Didier,

>The bandwitch on the CT60 is 10 times faster than the Hades 060. There are no
>060 on the world who use SDRAM ! The data cache on the 060 is 8KB not 256KB.

Nice figures, but these don't mean anything to me. Are we talking about 20,
50, 100 or even 200%, or just some measly percents extra?

>Humm... benchs. You cannot compare this amiga 060(-PPC) accelerator card
>with the CT60 like you cannot compare a CT1 to a CT2.

It seems to me that it's easy enough to compare different configs, how long
does it take to rotate a 2Mb TIFF in Photoline, in what amount of time can
Calamus display a certain page, how long does it take to pack a well defined
amount of files, how long is Aniplayer busy converting a 3' WAV into an MP3
etc... These are "real life" tests, and they mean much more to average non
technical users like me then all the blablabla about bandwidth and advantages
of using SDRAM.

>Sure you cannot encode in real time a DivX on the CT60, but I think it's
>possible to obtain 2-4 frames/s (Aniplayer can encode DivX3/4 now ;-))

That's not even slow motion....

Hi Hallvard,

>Now, is there a proper working icon editor/organizer available for the
>Atari platform?

Take a look at "Icon Extractor", this program was released last year and
entered the Magic Online contest (what ever happened to Bengy?)...
As far as organising icons go and extracting icons from "weird" icon formats
this program will suit your needs. Unfortunately it doesn't contain an editor
so it only meets half of your requierements.

>There is one bad thing about ASH Emailer (and the main reason I don't
>use it myself): it has no support for ISO 8859-2 character set
>(where the Polish national characters are located). And that's a pity... :-
>(

It's possible with a little fiddling ;-), it's a undocumented feature... all that's needs to be done is to change the ISO-8859-1 line in the header of a mail to ISO-8859-2, and KeyTab, Dragfont and a appropriate characterset must be installed as well. Drop me a mail containing some of the Polish characters and I'll send you a screenshot back of Emailer displaying them in full glory.

> and have PC emulation software provide the Hard Disk emulation so we can
> actually use the PC hard disk as the ST hard disk?
>

Well I guess there is "kind of". I seem to think there are some plans for an
ASCI -> ISA adaptor for use with
NE2000 network cards? You could then link the PC using an Ethernet cable and
either NFS
or SMB networking would allow access to the PC hard drive, but I know thats
not what was meant.

And whilst this sounds fine in practise to really implement would not be
straight forward.
If you went for the real low level solution you would have to dedicate a
partition to the ST
and then how would you stop the PC messing with it. Or you could create just
a file on the
PC, but then you would need to translate the i/o addresses etc...

In practise its easier to do ASCI to SCSI (they are meant to be similar) and
just stick
a SCSI drive on the end. Or to build an IDE interface and again use the disk
locally.

Hi Lonny!

L>I have similar problems with my TT. So it's not wired at this time. A
L>SCSI option would be nice.

Well, the TT having an ACSI port, too, you could go for the ACSI port solution
by Dr. Thomas Redlberger and Elmar Hilgart, which should become available in
the near future.

For the Falcon owners, this is no solution, though :-(

With best regards
Ekkehard

Hi Lonny,

>I actually do that on my Hades060 without images, audio CD's to be exact and
>it is a SCSI cdrom burner. On top of that the hades has the same slower
>SCSI bus as the original TT yet 8x burning works.

The SCSI bus of the Hades can handle speeds up to 5Mb/sec, the TT can only handle something in the region of 1.8Mb/sec, and that's quite a difference. Unless you're using a very ancient harddisk which I doubt, then the average transfer speed should be *at least* 3.5Mb.
BTW: Audio CD's are not a good example because they don't put much strain on the system. On a simple ST with a LINK97 interface, burning Audio CD's at 2X isn't even a problem. I have no idea what software you use, but AFAIK you can't create an image of a to be created Audio CD, Audio CD's are created in track at once mode, and there's no such thing as an image involved for TAO recording...

>If the ct60 has more bandwidth than a hades as I keep hearing it should be
>able to do 8x as well, the falcon is actually scsi 2 if I recall correctly.

What has bandwidth and/or processor power got to do with the physical limits of the SCSI-bus?

Cheers from Belgium
Dennis

Well to tell the truth I haven't tried it with an STe, but on this page :

http://www.myatari.com/bc520hw.txt

If you do a search on SH204, you will see it says not for STE.

That's where I'm getting this info from.

Hallo Son of!

SOM>I mean is there like a cable that can run from ST hard drive port to
SOM>a PC, and have PC emulation software provide the Hard Disk emulation
SOM>so we can actually use the PC hard disk as the ST hard disk?

Yes. Well, not exactly. There has been a device to achieve this, though (kind of). There once was a PC-Emulator which in fact was a complete little PC, attached to the ACSI port. This device's memory could be used as a fast RAM-disk on the ACSI Port if not in use.

With a Falcon or TT, you could just link the SCSI chains of the Atari and the PC, provided that there are less than 8 devices (including both computers). Then both computers can access all attached drives, but you've got to be very careful with writing data to the same device from both computers.

The best (or rather: only) way for STs would be to go for an ACSI-to-ethernet adaptor and use Samba or FTP-Server on the PC and some client on the Atari.

Other than that, you could also use a crosslink parallelport cable and PLIP to interconnect the two machines.

I can't see why it won't work on an STe the DMA prot is supposed to
be the same as other STs. There were some issues with some hard drives
which were cured by updating the DMA chip. However this problem affected
"most"
types of ASCI <-> SCSI adaptor not just SH204s so if you have an STe with
the duff
chip you probably need to fix the chip.

Search the archives at groups.google.com for more info.

I thought there were usb to rs232 serial devices for the mac, just a simple device that has nothing to do with localtalk, appletalk and such. Have you looked for something like that? Modem2 at 115kbytes/sec would be just as usable.

I'm holding out for a scsi or asci device myself, as the ethernet speed on the hades already has me hooked. ;O)

Hi everybody !

I get again a private net access at my new home...
And I follow again the projects.

The news :
- CT60 is gone to the production factory, yesterday, Tuesday, the April 2nd, 2002 !!
Cards will come back in 1 month !
- Patrice Mandin joined the developer list of the CT60 with DOOM & QUAKE and told me that he is sure the 2 games will run on CT60 !

So Vassilis figured it out eventually? :-) He told me that he was
contemplating such a project a long time ago, but said that it was
difficult since he had to reverse-engineer the API.

Actually the Falcon LAN port is 230400 bps which is almost 30KBps. Decent
for internet stuff.

Joshua.

> > Humm... benchs. You cannot compare this amiga 060(-PPC) accelerator card
>
> I didnï¿½t want to compare any 68060 solutions. The numbers only demonstarte
> how powerfull is the JIT 68k emulation.

No it's just 10 times faster than this old Amiga card:
- 060 100 MIPS 50 MHZ
- Athlon something like 4000 MIPS 1,2GHz
<=> 500MHZ 060 (?) with a CPU 40 times (?) faster !

Now this some true results (not benchs) ;-)
under MagicMac/iMac 500MHz with his poor JIT (?) with an avi
file CookieBlues_340x176.avi 94 seconds DivX4/mp3 converted in
DivX3/pcm:
- Aniplayer/libavcodec compiled with GCC-68K 2.95 => 330 seconds
- ffmpeg/libavcodec compiled with GGC-PPC 2.95 => 47 seconds
So the MacOS 68K emulation in this example is 7 times slower than the
native PPC code.

> > Sure you cannot encode in real time a DivX on the CT60
>
> Thatï¿½s one of the main reasons why Iï¿½m not interested in this card.

And you cannot encode with this PC in real time, the CT60 can reduce
to a minimum a 5 times faster (more because the 060 can use the DSP for
MP3 decoding), it's not enough.
DivX encoding is not possible under emulation.
Sure you can buy a PC at 2GHz but in this conditions, I prefer buy a
CT60, it's the same way of the spirit atari.

Under PPC, maybe a G4 is a solution GCC can produce code 10 time faster
(a maximum) when the altivec is used.

Regards,

Didier.

Source record: 36256

Hello all.

I just got a Falcon in a bigtower with lots of hardware extensions.
(Yes, iï¿½m going to get professional help...)
One of these goodies is a Magnum 8 Mb fast ram card on the extension
port.
The st ram is a standard 4 Mb. I have a 16 Mb (14 Mb usable) st ram
extension in one of my other two(..) Falcons, so i tried the 16 Mb st
ram in my new bigtower. Alas, the Magnum boot program couldnï¿½t
find the Magnum ram.
Can the Falcon only adress(find) a max of 14 Mb Ram, or is there a trick
for this?

Greetings, Freek Munniksma.

ST High should work. Otherwise you will need a scan converter. Many
exist, and I'd try looking at www.softhut.com or some other Amiga
dealer, since they use them.

The CPU in the falcon can only address 16MB of physical memory - subtracting
2MB for TOS, IO space etc., you get 14MB of address space that can be easily
used for Ram.

I am not sure if the Magnum should work with a 16MB SIMM (the development
was long ago - I can look it up if you want to), but in any case, the amount
of ST-RAM plus TT-RAM can not exceed 14MB.

It works!

My SH204 works with the STe!

It's that particular SH204 listed on the wqebpage has gives the trouble, not all as someone else here pointed out. Mine works fine.

It's not JUST a fax machine, but it is THE fax machine, and so needs
to be on constantly.

A (second) used Falcon and a CT060 is exactly how I did it!

From: northstar2010@_I-hate-spam_yahoo.no (Hallvard Tangeraas)
Date: Mon, 01 Apr 2002 22:47:37 GMT

Hi Hallvard,

>Yeah, that would be great (which would also mean not having to pay
>import duties/taxes). How much approx. does an upgrade cost?

IIRC it's 20 Euro (DM 39) but take a look at the website to be absolutely
sure...

>>if you run a lot of Atari software that uses the FPU. All the PPC
>>processors are crap when it comes to emulating the FPU in 68xxx mode.
>>But with PowerFPU installed however, the emulated FPU is really *fast*.
>
>How much does PowerFPU cost?
>Any downsides of using it?

PowerFPU costs $29, AFAIK their are no downsides using it, it's a Mac control
panel application which you can easily turn on/of. All the Mac 68K programs
running on a PPC will benefit from it greatly as well (i.e Filemaker Pro), IMO
anyone using MagiCMac on a PPC should consider seriously using this program.
Description: "PowerFPU is a commercial 68K emulator for PPC computers, by
working closely withy the built-in Apple 68K emulator and re-directing the 68K
FPU calls to the PPC CPU, the appliaction provides extremely fast 68K emulation.
PowerFPU is over ten times faster then the Apple 68K emulator and faster then
most versions of the Motorola FPU chip itself."

>> Before you do take a look at http://www.newsell.de , this firm sells brandnew
>> UMAX PPC 603 and 604 clones, the machines can be expanded all the way up to a
>> G4/500Mhz with a Sonnet processor card. They sell configurations ranging from
>> a barebone tower to a fully expanded G4/500Mhz with USB, Firewire, etc...
>
>Yes, but I have to keep in mind the import duties, taxes and postage
>before I have it here.

Postage through Europe costs $20, not unreasonable considering the volume and
weight of the package. As for duties and other costs, this is something you can
calculate yourself.

>It'll probably be a lot cheaper to buy a second hand PPC Mac with some usable
>specs, but still not "the latest model".

The Pulsar DP is a Mac 9600 clone, build to the exact same specs. Umax hasn't
chipped on costs, the quality of this machine is outstanding, and considering
it's brandnew, you'll have to look very hard to find a comparable second hand
offer.

Cheers from Belgium
Dennis

What I've done is set up an old 486DX2-66 (upgraded to a 83MHz Pentium Overdrive)
running Debian Linux. I use Uniterm to upload and download files from my ST and
connect my W2k box to it using Samba. It also runs netatalk so I can connect
my Mac Color Classic and IIcx.

I haven't tried setting up IP networking with my ST yet though.

How about cards like the Afterburner, CT2 and CT60 that say that you can use up to 256Mb of TT-RAM? I think the way it works is, you can't have more than 14Mb accessible ST-RAM, but can have any amount of TT-RAM the card you get will allow. Someone please correct me if I'm wrong.

of your later questions....

> There are network hubs that have Ethernet and (DSL?) High speed phone
> access, combined in one unit. I don't know if these are independent or
> what.

You're probably thinking of broadband routers -- things like the Linksys
BEFSR41 or NetGear RT-314. These devices function as network routers
(albeit very simple ones compared to what ISPs and backbone operators
run), and they often include hubs or switches so you can link multiple
computers to your broadband modem. They typically use a tool called
Network Address Translation (NAT) to let you run multiple computers on
one external IP address.

> Can I hook up an ethernet solution to this Hub

Yes. In fact, with several computers, you'd need a hub or switch to link
them all, assuming you're using recent twisted-pair wiring and not
ancient coaxial stuff. For local use only, this hub or switch wouldn't
need to have broadband router features, though.

> (2) If I can do this, is their a possibility for the High Speed Phoneline
> access. As this is a possibility in my area.

Yes. If Digital Subscriber Line (DSL) is available, it should work via
a broadband router to provide your STs with Internet access, once
you've added Ethernet and TCP/IP to the STs. (I'm basing this statement
on solid networking principles, though, not actual knowledge. I'd be
shocked if a working ST TCP/IP stack did NOT work for DSL access via a
working broadband router, though.) In fact, many DSL providers use a
protocol called PPPoE to assign IP addresses. I don't know if any of
the ST stacks support this. If not, a broadband router (or a computer
running some other OS configured to do the job) would be the only way
to link an ST to such an ISP. Also, some ISPs may get obnoxious if you
have problems under anything but Windows, but you probably already
figured that....

> I am looking for an "Atari" solution, however, perhaps I may have to buy
> a Windows driven computer and use it for the High Speed Internet

> connection.

Nah. Personally, I use a ZyXEL P-314 (the OEM version of the NetGear
RT-314) on a cable modem, and it works flawlessly with quite a zoo of
OSs, to which I expect to add an Atari TT soon.

This might just be an old memory cell burping, but I recall the Magnum
card utility sets alternate ram at a different location than where TT
Ram (and Afterburner or MightySonic alternate ram) is addressed. That
somehow limits the maximum alternate ram address space. I think that
was how it was explained to me, and kind of what I saw hacking the
utility.

Elliot,

I just recently solved these problems with my falcon. Some people get bad RAM inside the DSP which is a very bad thing, and unless you want to solder in a new DSP, you're cooked ;) Your falcon might not have the bass boost/line level instead of mic level hardware fix installed and or The DMA fix. These two fairly simple hardware fixes should be your first suspect.

PPPoE is not available unless some major coding break thru has happened
recently. ;-)

There is a DHCP client for MiNT-Net, it might be beta and I've not tested it
myself. I got lucky and my ISP has static IP, however I bought a D-Link
DI-704 so I could connect more than one machine.

Mike,

You're absolutely right, except that when I read over his original post, I got the feeling he wasn't looking for somethign like that. If he wants a simple networking tool that will allow a PC's disks to be used on the atari over a slow link, he can simply look to ghostlink or something of that nature. But I had more of a feeling he was intending to use it directly through hardware, which would be absurd unless an ACSI ISA/PCI card was built for the PC (why?! ;-)) or you did the direct scsi to scsi link to PC in WHICH case why not just use the scsi drive directly? I was only trying to drive at the fact that it would be rather redundant as the atari can use pc disks directly. ;-)

Cheers,
Mark

Hi,
It still exist another way.
SMC broadband routeur, can work alone.
It is a java prog on eeprom:-)
Java exist too for tos computer:-)
The dhcp stuff is integrate in the" barricade".
After that you have a compl�te standalone routeur,
independant of O.S.
So, you can do after that what you want:-)
Share internet connection
Use a local lan ethernet network with firewall protection.
It still exist too a special compil of samba to share printers:-)
with linux & tos &MiNT for exemple.
bye

MD> Atari. In theory an emulator for a PC is something that is possible but
MD> never has been done. And it would be rather expensive and still require
MD> a PC! ;-)

Wrong 8^)

Look for HDD_DMN, a good networking program to connect a PC to the Atari
using a cable on the parallel port, quite fast, project born together with
ParCP that now is the best for this purpose, HDD Demon stopped development
and made sources available.

They we may speak about sharing the scsi chain between PC and Atari things
that I did at the times when I was developing MikeNet, again doing the same
sharing between Ataris on MIDI cables.

> Can the Falcon only adress(find) a max of 14 Mb Ram,

The falcon has only 24bit address BUS, so it can address only 16MB of total memory.
14MB is for RAM and rest 2MB are for TOS ROM, registers of custom chips, additional ROM (ROM port) and some reserved space.

> will allow. Someone please correct me if I'm wrong.

No. Any card with the new CPU has it's own memory controller for FastRAM. So you can connect 14MB ST-RAM into Falcon motherboard + many MB of FastRAM (how many depends on the memory controller, the 68030/040/060 can address up to 4GB).

> No it's just 10 times faster than this old Amiga card:
> - 060 100 MIPS 50 MHZ

No. It is up to 25 times faster for some tasks.

> - Athlon something like 4000 MIPS 1,2GHz

To compare 68k MIPS with a x86 MIPS (or Dhrystones) is a nonsense.

> <=> 500MHZ 060 (?) with a CPU 40 times (?) faster !

The point is, that you can buy a complete "500MHz 060" based computer for
the same money as the CT60.

> Now this some true results (not benchs) ;-)

The true results are that I can play Quake under WinUAE-JIT on a reasonable
speed (no less than 10fps) up to 1024x768 resolution on my 900MHz Athlon.
Without JIT i have 2.5 fps in the 320x240 (same Quake and same WinUae, only
with disbaled JIT cache), which is, BTW, about the same result I have in
Aranym.
If you want benchmark Quake under MagiCMAC, just type "timedemo demo 1" in
the Quake console.
Another true result is that I can play VCD (30fps, layer2 soundtrack) on the
same "machine" at full speed.

Sure the WinUAE is not comparable with Amithlon or Aranym, because it is
still a complete Amiga emulator running under windows. However, it's easiest
way how to explore the new dimensions of 68k emulation.

> > > Sure you cannot encode in real time a DivX on the CT60
> >
> > That's one of the main reasons why I'm not interested in this card.
>
> And you cannot encode with this PC in real time, the CT60 can reduce

Oh sorry, I thought that "encode" was a typo.

> DivX encoding is not possible under emulation.

But DivX *decoding* at full speed should be possible. I don't say it will
work on any 600Mhz Celeron, but on 1Ghz K7 in should be possible (and such
CPU doesn't cost more than a full tank of benzin ;). In short time there
will be a 64bit hammers from AMD....

>be nice.

No figures, but you can draw conclusions for yourself since the only real
alternatives are using the serial or MIDI ports.

>2a) My Falcon just isn't Magic Friendly for whatever reason. And I
>haven't installed Mint or Mintnet, but run Geneva or Straight TOS and
>STing.

This might have a bearing on what you decide.

>2b) My TT Runs mainly Magic 4.0 and Sting or PPP Iconnect. I want to run
>Magicnet, however, one of the instructions suggests that the OS handle
>long file names. Is this absolutely required? I am lazy and really don't
>want to update to a newer version of Magic.

It's absolutely vital if you want to run Magxnet.

I think you might end up using STiNG and ftp to access other computers in
your network - especially if you're keeping to plain TOS on that Falcon.
Others will have to advise how MiNT would work/fit in in this situation, but

I suspect that you won't get the simplicity of Magxnet and BNet to access
the other Ataris in your network.

>Also, is the PPP/Iconnect solution pretty much isolated with regards to
>network solutions? Am I stuck with this as a solitary dialup solution?

Only if you use IConnect clients, and even then Vassillis will (I hope)
release the IConnect gateway, which seems to work very well.

I'm not going to attempt to answer your other questions as I'm a newbie at
this - and I'm not sure what you mean by "high speed telephone access". If
this is ADSL then you'll need a PC as an intermediary with a router (which
can be software) AIUI.

Let us know how you get on with this, I shall be following this thread with
interest!

Cheers

Is anyone using aFTP with Magxnet, or can suggest what I'm doing wrong please?

I've applied Vassilis' patch to the MiNT version of aFTP and have started it it by opening the "U" drive and navigating to it from there, but I'm getting the "Cannot resolve host" error message without a flicker from the modem.

Any insights? I can use the Magxnet CAB overlay with no problems, but a preliminary test with aMail also failed with a "Cannot connect to POP server" error message.

Cheers

Just a word of warning. If you have the duff DMA chip the effect MAY not
happen immediately.
It can start after things have got warmed up (say 15 to 20 mins?) use.
Sorry I can't be more precise, its been a long time....

They should all work fine as long as there are ethernet-drivers for
Magxnet. And I believe there are. Don't know about PPPoE and DHCP though.

Not proud, but *very* satisfied :-)

>Maybe he sells two or three packages a month. That'show he enjoys Atari
>computing. In the US, that is called a home business, no matter how
>inefficient he operates. You don't have to be a genius here to run a
>business. He seems to have good feedback. He doesn't need verbal assaults
>from some self-proclaimed loudmouth, even if his post are sometimes
>unorthodox.

Frankly, I don't care if he sells a truckload or only one package a month, I don't like people posting here and expecting a reply by personal mail, if he can't be bothered reading the replies, then he shouldn't post here in the first, place, and another thing I don't like is his weekly spam, as far as I'm concerned he got what was coming to him... I consider his weekly spam to be a verbal assault as well, he's doing it for years now and anyone objecting to it is disregarded or being told off. So yes, he needs a lot of insulting from loudmouths like me. It's not because you don't mind his spam, that everyone here approves of it as several posts in the past have shown time and time again.

BTW Except for Peter who inadvertedly gave him a wrong email address, AFAIK I was the only one here that actually helped him out and pointed him in the right direction, which only goes to show that I'm not complety evil.

Cheers from Belgium
Dennis

Brian Van Tilborg <madmax@bfree.on.ca> wrote:

> 1) Is this solution relatively fast? A benchmark I can understand would
> be nice.

I don't have any benchmark results right here, but on my Milan with a PCI ethernet card and MiNTnet, I get around 700-750Kb/s on my 10Mbps network. My Falcon/Afterburner with Elmar Hilgarts ROMport adapter and MiNTnet is a lot slower, around 100Kb/s IIRC. My TT with the same adapter is equally fast with MiNTnet and slightly slower with STiNG/MagiC. However, STiNG seems to slow down the system a lot at this speed. I haven't tried Magxnet on my TT yet, but from what I've heard it should be about as fast as MiNTnet.

> 2b) My TT Runs mainly Magic 4.0 and Sting or PPP Iconnect. I want to run
> Magicnet, however, one of the instructions suggests that the OS handle

I'm afraid I can't answer this, as I don't know enough about Magxnet.

> Can I network, Atari Computers running STING and MagicNet, together,
> and/or include Magicnet and Mintnet driven computers in the network? As I
> may get another TT with Mint on it?

No problem. STiNG, MiNTnet and Magxnet all use TCP/IP, so you can mix and match as long as you set up the network properly. With the exception of Magxnet (well, I have used it slightly, but that was an experimental version a long time ago) I've used all of these with success. I even have a few Windows machines in the same network, works great.

> In a worst Case Scenario, I know I can network Sting, but I am very much
> aware that Mintnet and Magicnet are much faster and possibly more
> reliable.

I don't think I've had any problems with STiNG being unreliable, but it doesn't perform nearly as well as MiNTnet.

> Also, is the PPP/Iconnect solution pretty much isolated with regards to
> network solutions? Am I stuck with this as a solitary dialup solution?

IConnect is modem only. It can't even handle nullmodem-connections.

> I believe both Sting and Mintnet, (probably magicnet too) have masking
> and remote dialing, unlike Icconnect.

Don't know about IConnect, but both STiNG and MiNTnet have it. I used it for a long time with great success. Had the modem connected to my Falcon

running MiNTnet, and my TT and STacy running STiNG or MiNTnet (depending on what OS it booted) connected to the LAN.

> Can I hook up an ethernet solution to this Hub

Can't answer your questions about this, I don't even have a phone line anymore...

> I am looking for an "Atari" solution, however, perhaps I may have to buy
> a Windows driven computer and use it for the High Speed Internet
> connection.

Perhaps, it depends on your ISP. My ISP use a Cisco DSL-router that takes care on anything, I just connected it to my hub and changed the defaultroute on my computers to point to the router. That's it, no PPPoE, DHCP (well, the router has a DHCP-server and I would probably have used it if I hadn't had my LAN configured already) or anything. Just wash'n go.

Does the author of Fiffi get paid? If he does, then Fiffi isn't free at
all. In fact, for most users (I don't think a majority of CAB-users also
use IConnect) Fiffi is just a piece of software they have to pay for but
don't use. But I think I've said that before ;-)

Hi GokMasE

| Is there such a thing as a collection of free speedo fonts on the www
| somewhere? I'd like to have a few more to chose from when messing with
| Highwire here.

Free is not the problem, its transportability. If you design a site with a Speedo font its not going to look right on almost every machine in existence, since very few people use Speedo fonts.

Hi Pete

| >There is one bad thing about ASH Emailer (and the main reason I don't
| >use it myself): it has no support for ISO 8859-2 character set
| >(where the Polish national characters are located). And that's a pity...
:-(
|
| A far more serious shortcoming of the ASH Emailer is that it
| often produces overlength lines that are difficult to read in OLRs
| that don't wrap lines very well.

This has been discussed before, its the responsability of the recieving
software to format the line correctly. Blame the relevant software for its
own shortcomings.

|I think the RFCs have a maximum of 76 chars/line, but the message you were
replaying to had far
| more... up to 86 when including the quote marks.
| I understand that the Emailer's auto-wrap doesn't work properly and
| it's better to use manual line-breaks.

eMailer's wrapping works fine for me.

Someone sent me the components to do the Bass and Line level adjustments but this sounds much worse, really crackly.

ACE works fine, sounds great in fact and so do many Demos, it is just a number don't. Maybe it is the just the above, I hear these are the same mods as done on the C-LAB Falcons so maybe these demos were just done on those Falcons and never tested on the originals.

Is there any test software for the DSP memory?

Elliot...

hi!
> Yes, but no
The first point is the processor: the 68030 can adress 4 GIGA of memory.
the second point is the tos limitation :only 1giga.
between, it still exist choice :exemple centurbo
specific hardware with original ram+edo on the card:-)
another choice:
virtual memory, the hard drive is "ram" too:-)
bye!

The Speedo fonts I have came with NVDI and WordPlus5.
And since NVDI can also use TrueType and Postscript Type 1 fonts, I have
also installed some fonts that are available (free !) for Ghostscript, and
fonts that I found in a sparemint RPM package (URW fonts, also free)
I'm not sure if Highwire can use these, but I guess it's no problem when
using NVDI.

Hello,

Following the progress made to SDL, I updated both Doom and Quake.
You now can give a try to pmdoom-0.28 and nuq-0.7.
Thanks to people who tested the previous versions and sent me bug
reports. There is still audio and cdrom support missing in SDL. So one
day it will be complete.

>to make the CPU with a 24bit address bus to address up to eight alternative
>16MB memory spaces. Those outputs are obviously used for *something* in Atari
>machines (because they are connected to other chips)- but, any idea for what?

After reading St Internals it's possible to use four 16MB
blocks. How compatible this is I don't know. Some FC
combinations were reserved for future use/implementation. I
know it's possible on ST to have address like $01C00000. This
is the place where alternate RAM is mapped to from an ET4000
graphics card. And docs say "to stop OS doing DMA transfers".

>aspects of the circuit.

I never knew a 68030 was decided *that* late in the Falcon
design. It seems strange that in 1992/1993 they'd still be
considering a 68000!

Hi Michael,

> - Interrupt acknowledge cycles

Yes, all FC goes high, and A16-19. I think the other address lines go high too but A16-19 is what 68000 datasheet says to look for. A1-3 tell the chipset which interupt is being serviced, I believe the same code as on IPL lines.

> - write protecting the first 1k (or was it 4k) when CPU is in
>user mode

1024 bytes indeed. All the vectors point to addresses here.

As of yet, Highwire will fail to render text correctly unless Speedo fonts are used. This will probably change later on, but for now it would be useful to have a little collection of Speedo fonts for tests.

> I do not know if I have problem with my code, or with mint installation
> or with the emulator!
> Can somebody send me a small C program (that does nothing!) and the
> complete compile and link command, so I can test ?

dumb.c :

/* dumb.c */
#include <stdio.h>
#include <stdlib.h>

int main(int argc, char **argv)
{
printf("this is a dumb program\r\n");
getchar();
exit(0);
}

On my cross-mint installation I compile it using :

m68k-atari-mint-gcc -o dumb.prg dumb.c

which creates a working dump.prg executable of around 100 kbytes.
(the getchar is here to let time to see the message before the
program ends, when launched from the desktop)

On a true Mint installation the command is probably

gcc -o dumb.prg dumb.c

Laurent.

No. The video-ram can be anywhere in the ST RAM area, and the Videl
registers take up a few bytes in the normal IO space.

>How about cards like the Afterburner, CT2 and CT60 that say that you can use
>up to 256Mb of TT-RAM? I think the way it works is, you can't have more than
>14Mb accessible ST-RAM, but can have any amount of TT-RAM the card you get
>will allow. Someone please correct me if I'm wrong.

Only if the card has its own CPU - the CPU in the falcon can only address
16MB, no matter if you declare it as ST-RA or alternate RAM (like the Magnum
does).

If a card has its own CPU, it can easily add TT-RAM at addresses above 16MB
- the limit would be a bit less than 4GB then.

Right. The Magnum RAM is at addresses below 16MB - the falcon CPU can not
access memory abovce 16MB. "real" TT-RAM (in a TT) is at addresses above
16MB.

>COMBEL/VIDEL combo.

What about making a cut on the /AS (or whatever the equivilant
is on 030)? You could intercept this but I'm not sure how
effective this would be, as the other control signals would
still be flowing to the COMBEL/VIDEL. Even if the 68030 was a
last minute thing, that last minute could have been used to
stick the extra addr/data to exp connector!

I am not getting 5mb/sec on my hades scsi bus, only 1.2 to 2.5mb tops using
the extendos benchmark. I also use the extendos software.

> What has bandwidth and/or processor power got to do with the physical limits
> of the SCSI-bus?

Forget I mentioned it.
Needless to say, why not wait and see before predicting certain things
cannot be done. Anyway, it's not an issue that important to me, I was one
of those users who could not wait and bought a Hades. I sold my Falcon
rather than hacking it up. ;-)

Maybe it's wishful thinking on my part, but I'd like others to enjoy 8x
writing.

Wouldn't this be more of a chipset limitation? I don't recall there
ever being a "24 bit" 68030 - AFAIK, all '030s can address 4G (32 bit
addresses), with all addresses being "unsigned" (ie addresses 0..4G,
rather than signed -2G..0..2G)

> >the second point is the tos limitation :only 1giga.
>
> Huh? where does this limit come from? I am quite sure TOS should be

being
> "negative").

Based on the address map in the back of the Compendium, RAM is
allocated the following addresses

0..14M 00000000-00DFFFFF ST RAM
16M..4064M 01000000-FDFFFFFF TT RAM
4080M..4094M FF000000-FFDFFFFF Mirror of ST RAM

(with the last item being a feature of the chipset)

The "Ultimate Virus Killer 2000" is the industry standard virus killer for the Atari ST/TT/Falcon platform. The program has been around for about 14 years, and turned shareware a while ago. The latest version, 8.2, was released October 10 2001.
There is now an official "UVK 2000" support site where you can download the program, find descriptions of all Atari TOS-platform computer viruses (and their symptoms) and more. It's located at http://www.uvk2000.com.
This message is being sent to three newsgroups. If you think this constitutes spam, or if you think this message does not belong in your particular newsgroup, please contact me via the website and I will refrain from posting to the newgroup in the future.
Thanks for your time.

Are you a member of the former 16-bit Atari 'scene'? Did you, perchance, visit the "ST News International Christmas Coding Convention", in Oss, Netherlands, December 1990? Or the reunion in December 2000?

Then you should not wait a second longer and surf over to http://www.stniccc.com to discover that, in fact, there is a totally revamped site that covers these - and other - Atari scene events. It also contains Atari Scene Central, a repository of information on where all Atari 16-bit Scene people are now...

Of course, it is a chipset limitation. The falcon chipset was originally designed for plain 68000, IMHO.
The 68030 should have all 32 address/data signals, however connected are only 24/16.
The worst thing is, though, that the full 32/32 BUS is not present at least on expansion slot. This would be really cool, because it would allow to design a simple FastRAM controller for any amount of real 32bit FatRAM. In addition, this solution would speed up Falcon at least 2x without any accelerator board.

I believe the real secret is to size the editor window such that the original poster's message just fits without wrapping.

>more or less confusing. In the menu "Options" one can set the maximum length
>for mails and/or postings. These settings however have nothing to do with the
>way a mail or posting will be sent. The settings apply to the way the mail is
>displayed on the screen.

This particular option is under the "Editor" section, so one might expect a somewhat different result, but I still find it to be rather confusing.

I also don't like its use of "quoted-printable" for emails, as I have to then go into the Database PM folder and edit the header and remove all the "=2E"'s before many mailing lists will accept the result.

There's also no built-in way to print out messages, but thanks to Sean Barbieri's work on this String Server can be installed to print via Idealist if one double-clicks a message with a CTRL or SHIFT key modifier.

>although DDP translated the program there's no English manual, so the user has
>to learn the ins and outs of the program by trial and error....

And by asking questions in here of course ;-)

>>standard Atari and
>> you can't improve on that.......
>
>Well, you're entitled to your own opinion. I disagree.

I'd also prefer my own back panal arragement. I need extra
things and remove some things. The Atari video port and DMA
port will be moved. I'll also be putting a "normal" 9 pin
serial port. I need the video port redirected to be able to
have it switchable over to graphics card. I may even have two
ports so I can use two screens. I also don't need cutout for
STFM PSU as I have my own chunky PSU. So really, buying your
rack case would mean I'd have to modify it anyway.

2994. April release of Eureka

Newsgroup: comp.sys.atari.st
Date: 2002-04-05 11:16:17 UTC
From: lecoat@atari.org
Message-ID: <e895cb13.0204050316.83f0ee5@posting.google.com>
Source record: 36190

Hi,

I have updated on my Web site, the April release of Eureka.
It is a 2D Graph Decriber and a 3D Modeller. What's interesting
with this, is that it's the 6th anniversary of its release on
the Web. No, no, it's not a dirty April fish. This is really
the 6th anniversary, and let imagine how many progress have been
made since those years. I would have to thank really many
people for their support. That's really nice of you all. Nearly
everyone who knows Eureka have contributed. I must say that
Eureka has a monthly release, it's quite interactive ...

The last people I would have to thank are the team from
MyATARI that have nominated me for the 2002 awards. That's
a great satisfaction for me. I bet it will be good for me
and the fame of Eureka. That's great. Vote for me ! The votes
are closed on the 7th of April ...

I wish to satisfy you more every month.

Regards, and see you soon for updated news of ATARI Front-Line.

>official data sheets - they are only available to a certain customer, and
>are usually labeled with some 6-digit number that looks in no way like a
>normal Motorola part number.

I surprised Motorla were willing to make special for Atari, but
for sure, my 68030 doesn't say 68030. Same with the DSP, from
MOT too. I guess one way is to monitor the address lines with a
scope to see if they are connected or not. But really,
soldering wires to these pins is not something I'd like to do.
Which comes to saying, it'll be better to mount 68030 onto exp
connector, throw in some 0 waitstate DRAM, oh, we have a CT2 :)

>How big it was? Could this source be the base for some project for the
>Atari range of computerts?

I think a port was done, but even on Hades it was slow. I also
believe it's possible to run something like Netscape on a Linux
box, have a Falcon connected to it via ethernet and redirect the
console to the Falcon. This way you have the Linux machine
doing all the hard work, while Falcon displays Netscape in a
window :) Mouse/keyboard is also diverted.

>Well, it isn't too bad:-)
The 68030 can adress one Giga of ram with the soft"outside"
from Dr uwe Seimet:-)
The coprocessor is asynchron: so he can have his own speed.
The bus, i'm agree with you, but it still exist the design of the mother
board that you can read something from hard drive
and write in same time thru the bus, it is // wired:-)
It is just like "big station".
Another point it is possible to improove speed with different cache disk.
Nothing is perfect, but with atari, it still always exist solutions:-)
bye!

I only know of 2 options here, first we have Aranym (http://aranym.
sourceforge.net/) which not really is a complete Falcon emulator, but
it emulates some of the hardware. The other solution I know of seems to
be progressing quite a bit slower, but you could have a look here:

Icon Extractor is indeed meant for converting icons afaik, not
organizing them as far as I know. It seems to do a very good job at it
too.

> And "Interface" for editing and organizing colour icons. I would sure

I haven't looked into Icon Juggler, so exactly what would you expect
the organizer to do? I would have thought Interface should be quite ok
to use for organizing icons.

Except that ARAnyM only emulates enough falcon hardware to run
TOS 4.04. Their goal is to implement an emulator to run properly
developped GEM+TOS applications, not hardware-specific demos.
When alternatives to TOS 4.04 are available, ARAnyM might become
less and less a falcon emulator and more and more a generic TOS
emulator as times goes.

Laurent.

>Cheers Dan. Did the Starball authors do any other ST games ?

Btw. if I remember correctly, Starball was one of the rare games which
used the FPU if it was available- either the coprocessor FPU connection
(as in TT or Falcon) or the memory-mapped one (as in ST or MSTe).
The increase in speed wih FPU used was VERY noticeable.

By the way (and somewhat off-topic), MC68K processors have "function code"
FC0-FC2 outputs which, as some docs say, might be used (theoretically)
to make the CPU with a 24bit address bus to address up to eight alternative
16MB memory spaces. Those outputs are obviously used for *something* in Atari
machines (because they are connected to other chips)- but, any idea for what?

That's the question. AFAIK, Motorola never did a 68030 with "cut down" address and/or data BUS. Only the "LC" version without the MMU.
I personally belive that the 68030 in F030 has full 32bit BUS for both data and addresses.

> taken is a few hours to route these wires to the expansion
> connector! In theory it would be possible to solder wires to
> the extra pins but what with it being SMD it is almost
> impossible.

I had similar idea some time ago. I thought about soldering one wire directly on the 68030 (pin A24) to provide extra memory bank. One wire would be enough for additional 16MB and two wires (A24,A25) for 48MB of FastRAM (only 16bit, though). However, I didn't find the way how to block access into basic 16MB of memory, when I would access the new memory banks. That is most probably impossible without general redesign of the main COMBEL/VIDEL combo.

IConnect 1.8 and CAB 2.8 with I-Con.OVL 1.7.

> PS: a screenshot of IConnect running CAB downloading the above mentioned file
> is now in your mailbox.....

It isn't! :-(

But it turned out that when I used I-Con OVL but with MagXNet and
IConnect gateway, it *could* download that file. With IConnect
it couldn't. Really. In fact, IConnect itself works quite unstable
on my setup: it sometimes bombs while resolving. It seems to work
very "randomly", even more than MagiC itself...

>Falcon. I thought perhaps they managed to get some special "cut

Correct. A *normal* 68030 does have 32/32 address/data lines, ant it works just fine in a falcon (I had to replace a CPU once). However, I am quite sure that there were falcons which did not have "normal" 68030 CPUs - they were clearly not labeled 68030, and I am told that there were versions that had the pinout, but the "unneeded" additional address/data lines were not connected inside the CPU case.

It may be that Atari later used normal 68030 CPUs.

>down" version of the 68030 but it seems not. All it would have
>taken is a few hours to route these wires to the expansion
>connector! In theory it would be possible to solder wires to

The whole falcon is a 16MHz 68000 design, with the 68030 being added afterwards (with a lot of glue logic in the GALs). You notice this in many aspects of the circuit.

>16MB memory spaces.

Yes (four, not eight), but then you get different memory spaces for user and
supervisor mode - all operating systems used on Ataris would not work with
such a memory scheme, and even a fully protected OS would have difficulties
- copying data between user and kernel space gets quite difficult unless you
map *some* memory into both areas.

>Those outputs are obviously used for *something* in Atari
>machines (because they are connected to other chips)- but, any idea for what?

- Interrupt acknowledge cycles
- write protecting the first 1k (or was it 4k) when CPU is in user mode
- allow access to IO area only in supervisor mode

The meaning of the FC lines can be looked up in any 68000/68030 databook.

> Is the case you deliver already pre-drilled with holes for the disk
> drive, connectors etc. as shown in your picture, or not?

The din connector holes and the 2 floppy slots are cut, as is the opening in
the rear panel.
The rack ears are drilled. You need to drill the assembly screw holes unless
using it in a sleeve as 4U.
The rest of the pics will make this clear.

If I can't get the jpegs to the site I can send them to anyone interested
but they are large files.

Barrie.

> still be flowing to the COMBEL/VIDEL.

I discussed it with R.Czuba about two years ago. The result was, that it is
impossible without interption all of A0-23 wires between CPU and COMBEL.

> Even if the 68030 was a
> last minute thing, that last minute could have been used to
> stick the extra addr/data to exp connector!

As said, it will be most probably useless without general redesign of the
main heart of F030 chipset.

Funny that you mention it. Today I just visited

http://browserwatch.internet.com
http://browserwatch.internet.com/browsers.html

Here you'll find a list of webbrowsers for several different platforms:
DOS, MSWindows, OS/2, Unix, Mac, Amiga,.....but hey....NO ATARI ????
I already wrote the maintainer of the site an e-mail to tell him that
Atari TOS (compatible) computers exist, and that we have about 5 different
browsers "working" on our platform: CAB, Adamas, Wensuite, Lynx, and
Highwire is being developed right now. And these are not the only ones I
beleive.

This is something that goes beyond me. The 030 seems to have
32bit data bus, 32 address lines too. This is from the
schematics and looking at the number of pins on the 68030 in my
Falcon. I thought perhaps they managed to get some special "cut
down" version of the 68030 but it seems not. All it would have
taken is a few hours to route these wires to the expansion
connector! In theory it would be possible to solder wires to
the extra pins but what with it being SMD it is almost
impossible.

Source record: 36223

Hi all,

I have some trouble connecting a SH205 to my MEGA ST2.

(and I am an Atari Newbie... ;)

I purchased all via eBay and got the stuff today. The cable was already connected from HARDDISK IN -> MEGA ST

When I tried to start the Atari without any Disks in the Floppy I just saw three little bombs (or whatever) on the startscreen..

So I started the Atari with an inserted Disk. GEM Desktop appeared fast... then I tried to add the Harddisk to the Desktop.... but after adding it as "C" (upper case) the computer still tells me that this drive is invalid..

During bootup the Harddisk seems to start normally (no strange noises, the "active"-light flashes... but after the boot BOTH lights on the Harddisk are ON.. always... somehow strange for my taste..

Anybody has any hints?

thanx for helping!

Dennis Knake

How do you know?

Motorola makes lots of custom versions of chips which never turn up in the official data sheets - they are only available to a certain customer, and are usually labeled with some 6-digit number that looks in no way like a normal Motorola part number.

The above both need DSL Modems yes, can you recommend a DSL modem or Router
with a built in modem? I have ADSL coming to my house but nothing to plug
into the wall (as it were).

Correct - User Data, User Program, Supervisor Data and Supervisor Program.
If you really map these to different 16MB memory blocks, you have a very
interesting memory layout ;-)

>know it's possible on ST to have address like $01C00000. This
>is the place where alternate RAM is mapped to from an ET4000
>graphics card. And docs say "to stop OS doing DMA transfers".

This is a bit like virtual address, not a physical. The physical address is
still $00C00000, since the CPU simply ignores the upper 8 address lines -
however, TOS does not and thinks that this is alternate RAM. However,
accessing $00C00000 and $01C00000 gives the same data, so you still have
only 16MB adressable.

>considering a 68000!

Hm - just stumbled across photos of the original falcon (codenamed
"sparrow"):
http://home.t-online.de/home/BMaedicke/hardware/sparrow.htm

Thw bottom photo should be the plug-in card that plugs into the 68k socket
of a STE and which consists of a 68030, the DSP, and 5 GALs.

Now if you use a STE board with an improved viceo chip called Combel, you
are nearly done ;-)

Yes, such a search directed me mostly to info on how to use Speedo fonts under Linux, which is not exactly what I was after. I did find 4 speedo fonts on umich ftp archive, but some seems to lack ��� (nordic chars) and thus aren't a perfect solution.

Hello both.

Really you're both missing the point.

Whilst you're faffing about I've designed and produced a 2U case that will accept an ST mobo with no butchery.

The 4U version is simply the 2U version for you to fit into a rack sleeve, separating the lid and base by 2U and using a 2U blank to fill the space front and rear.

Basic metalwork skills are required but the difficult bit, i.e. cutting the apertures for floppy disk and CD rom, is done leaving you plenty of space to drill away to your hearts' content.

> So really, buying your rack case would mean I'd have to modify it anyway.

See first 2 lines! It's a basic case.

I'm not presenting it here as a finished product

I'll take my case over hacking a mobo any day.....

Barrie.

For example the text for a NEC Multisync 3D is:

"640x480" 25 640 672 768 800 480 490 492 525
"800x600" 45 800 840 1224 1264 600 600 606 624
"800x600" 36 800 824 896 1024 600 601 603 625
"1024x768" 46 1024 1064 1224 1264 768 777 785 817 i

* The 1st column is the name of the video mode.

* The 2nd is the Dot Clock. This is the pixel clock for the
video processor. It is the same CLOCK with the BlowUp.

* The 3th column is the hdisp (Horizontal Display). This is
the horizontal resolution of the screen. In BlowUp it is
the XRES value.

* The 4th column is the hsyncstart (Horizontal Synchro
Start). This is the distance (in pixels) between
the horizontal synchro and the beginning of the screen.
It is in BlowUp the LEFT BLANK.
LEFT BLANK = hsyncstart-hdisp.

* The 5th column is the hsyncend (Horizontal Synchro
End). This is the distance (in pixels) between
the horizontal synchro and the beginning of the screen.
It is in BlowUp RIGHT BLANK.
RIGHT BLANK = hsyncend-hdisp.

* The 6th column is the htotal (Horizontal Total).
This is the width of a line in total: synchros +
screen. In BlowUp this value is displayed in W:
parameter. RIGHT BLANK should be adjusted to have the
same value in htotal and in W:.

* The 7th column is the vdisp (Vertical Display).This is
the vertical resolution of the screen. In BlowUp it is
the YRES value.

* The 8th column is the vsyncstart (Vertical Synchro
Start). This is the distance (in pixels) between
the vertical synchro and the beginning of the screen.
It is in BlowUp the UPPER BLANK.
UPPER BLANK = vsyncstart-vdisp.

* The 9th column is the vsyncend (Vertical Synchro
End). This is the distance (in pixels) between
the vertical synchro and the beginning of the screen.
It is in BlowUp BOTTOM BLANK.
BOTTOM BLANK = vsyncend-vdisp.

* The 10th column is the vtotal (Vertical Total).
This is the number of lines used in total in one screen:
synchros + screen. In BlowUp this value is displayed in H:
parameter. BOTTOM BLANK should be adjusted to have the
same value in vtotal and in H:.

3040. Problem with sockdev.xdd

Newsgroup: comp.sys.atari.st
Date: 2002-04-06 17:30:30 UTC
From: jba4@po.cwru.edu
Message-ID: <3caf2eb8.14449888@news.cwru.edu>
Source record: 36241

Hey everyone! I've been having some trouble with my MiNT setup lately. I was hoping someone could sort this out. I'm booting freemint kernel 1.15.12 on my TT without memory protection. I'd like to run the X11/GEM server, but I have problems with sockdev.xdd. I don't think it even loads. The file is sitting in the multitos folder along with all my other drivers and files systems, which all load perfectly. I'm not sure what order things run, but I don't think that should matter in this case.

I'm attempting to use the absolute latest sockdev.xdd available in the MiNT-Net package off of www.freemint.de. I'm also loading the RealTek ethernet device driver, the sound driver, and a bunch of file systems.

On another note, I'd like to turn on memory protection on MiNT, but the system fails at startup every single time. Once it starts checking my Minix partition, it has to run fsck, which cause a memory violation, brinign the system to a halt. Any reason why this doesn't work? I thought I could turn on memory protection with the older kernels. As a side note, almost every unix program on my minix partition is a version that came with KGMD. I am using up-to-date kernels, but a lot of the utilities are old KGMD software. I'm not sure if this makes a difference.

Thanks in advance!

> into the wall (as it were).

In most cases, you're best going with whatever (external,
Ethernet-based) modem your ISP provides or recommends and a separate
broadband router. The reason is that compatibility between modems and
ISP equipment isn't always perfect. Also, using separate devices lets
you change ISPs without junking your router. If your ISP doesn't
provide an external Ethernet-based modem as an option, you'll have to
get something else, but separate products still offer the advantage of
increased flexibility.

That said, if you really must get an all-in-one unit, several companies
do make them. For ADSL, I recommend you check
http://www.dslreports.com, and particularly their hardware section,
which provides rundowns on various products. You may also want to do a
search on http://groups.google.com and/or post to the comp.dcom.xdsl
newsgroup with your query. Be sure to say what ISP you're using. You'll
probably end up being referred to models made by ZyXEL, Cisco, Westell,
Efficient Networks, and perhaps others.

> Atari range of computerts?

Mosaic was one of the, if not the, first modern GUI browsers. I'm not
sure what platforms it supported, aside from UNIX/X. By today's
standards, its features are slim (weak table support, no Java or
JavaScript, etc.), but it's useable if you don't need to visit sites
that rely too heavily on such flashiness. I'm sure it COULD be ported to
the ST, but it'd probably be difficult to do (except maybe for running
it in conjunction with an ST X server), and I'm not sure the effort
would be worthwhile, given that other browsers exist for the ST.

Hello!
What version do you have.
It still exist 3 options with the same name?
1) trial soft
2) complete soft only
3) a special "videl clock 32 with a frenquency quartz"
```

This is the first point, the second one is very simple:
It is d pend of your possibility of "monitor".

The better and the most secure today: multisynchro monitor:-)
Yes because, you can, in realtime, build your r solution in realtime:-)

```
The last one, for multitasking os use the tsr prg instead of the acc one;-)
```

```
you hnow what, i'm happy:-)

Source record: 36050

Hi Derryck

> Is anyone using aFTP with Magxnet, or can suggest what I'm doing wrong
> please?

I tried both aFTP 1.44 and 1.55 with Magxnet internally to a FTP server on
my PC.
From the PC to the ST is fine.
From the ST to the PC I always get zero bytes length files :-(

Connecting to an FTP server on the internet works. But same issue with
uploading.

I am using an ISDN router for internet access.
I just had to add another route line in MAGX_RC.NET:

route add default en0 gw 192.168.2.254

The IP address is the IP address of the router in my ethernet.

Best regards
Thomas

Source record: 36051

Hi Brian!

> 1) Is this solution relatively fast? A benchmark I can understand would be
nice.

Ethernet solutions between Ataris provide *net* transfer speeds (using FTP)
between 20KByte/s and 150KB/s (Falcon), cum grano salis with any IP stack
(STing, MagicNet, MINTNet) and network adapter.

> 2) I want to hook up a number of my Ataris, however, they are all running
> different OS.
>...

No issue. You can run STing on some machines (under TOS or MagiC), MagiCNet
or MINTNet as you like on others.
IP makes sure they can talk to each other.

BTW: If have MagiCnet running on MagiC 5.13 with just the standard 8.3 file
system.
I tested FTP-Server and CAB to work succesfully.

> There are network hubs that have Ethernet and (DSL?) High speed phone
> access, combined in one unit. I don't know if these are independent or
> what.

I propose you first set up an ethernet with all your atari machines hooked
up using the IP stack that fits the machine and OS such that all machines
can see (Ping) each other.

Then you install core TCP/IP networking software on the ataris. E.g. CAB,
aFTP, Telnet.

Then you may want to connect any decent *router* to this ethernet. This
router would have an ethernet plug and an ISDN or (A)DSL plug or a cable
modem plug.
I got such a configuration working nicely. The ISDN router I use costs about
EUR 250.
You would configure the router from any Atari using Telnet (mine is also
accessible from a dedicated RS232 port).
My two PCs also hang in this ethernet.

With this you do not need any pppoe or the like. This is all done by the
router.
You can have simultaneous internet access from more than one atari or PC.
The router provides Network Address Translation.
Some routers even provide basic firewall (filtering) functionality.

Best regards
Thomas

> you hnow what, i'm happy:-)

I know that.

I do not have blowup yet, but I have possibility to buy it on auction, and becouse I'm also buying CT060 (which also bost Videl) I would like to have information if it is still resonable to use Blowup, ie. if it put higher frequency to Videl.

I'm talking about hardware blowup solution.

So once more: what is the maximal frequency that Blowup may generate for videl?

3052. Re: SH205 Harddisk -> Connecting Problems on MEGA ST

Newsgroup: comp.sys.atari.st
Date: 2002-04-06 22:57:18 UTC
From: "Gerald M.-B." <gmb@wtal.de>
Message-ID: <a8nuhvpjp1@news.kdt.de>
Source record: 36054

Hi Dennis,

before you switch on your Atari system, you must insert the disk into your floppy drive which (hopefully) came with the SH205 harddisk. This disk will boot the necessary driver for your hard disk. When everthing worked well, you should see the desktop. Now you can add drives to the desktop or could start the utility from the floppy disk to format your harddisk. The Atari harddisk utility is also able to change partition C into a boot partition. By doing this you could boot your Atari system via harddisk. The SH205 driver / bootdisk won't be needed any longer for boot-up.

If you need further help (or the driver disk for the ATARI SH205 harddisk) just drop me a mail. I own a SH205 myself, so that I could send you the manual (in german), too.

I learned English in school for many years, but giving a "How / What to do" description in english still isn't easy.

Greetings from Germany.

Gerald

That Sparrow is just a motherboard. I had a complete Sparrow that I sold then it was sold again. I think it went for $325 on ebay last year. And it was very clean.

Hi,

I'm looking for a Soundpool Adat interface that connects to the DSP port of the Falcon. It allows you to send/receive 8 channels of audio to an adat compatible device. If anyone is selling one, or knows someone who is, please let me know.

Thanks,
Dylan O'Brien

Hi,

That is real nice, but what I was looking for (or contemplating)
was a DTP program that had some sort of music module.
One that had actual musical symbols (slurs, accidentals, etc.)
that could be used to "Fine Tune" your "manuscript"

Logic 2.5 has limited music symbols, inconsistencies in the way
Chord symbols are inputted, and tie and slur adjustments are
rather cumbersome.
Its strong point is music sequencing, not music notation.

Will Calamus make a .PDF file after you have done this procedure?

thanks

ken

Take a look in the \BANK\ folder. Do you see two files named BANK_E.LST and POPUP_E.LST ? If so the answer is simple. You have to edit (or create) a little file named LANGUAGE.INF that must be in the same directory as the main program. The file should only contain the word "EN" (without the "" quotes !).

If you haven't got the translation files in the BANK directory I can send them to you. I also have Dutch language files if you're interested ;-)

Score Perfect Pro is pretty good I think. I own the abandoned latest version 4.0 for Atari.

There also is a German-only program that is still being developed (I forgot the name, was it Music Edit ?). I haven't tried it yet, but I heard it runs, unlike SPP, in colour resolutions and under multitasking OS.

I love SPP, except that it doesn't like my CT2b, it doesn't run with MiNT, and further development on the Atari platform has stopped.

Martin

I'm looking for a freeware or shareware program that will record a 44.1K Hz AVR file (or convert to this format). I'd like to record the audio of my MIDI scores to my Falcon, and then burn a CD with CD-Writer. I've found a few programs, but none of them record at that sample rate.

Yes, but I also think some ATARI HDs had the problem.

> What exactly was wrong with the STE DMA chip? Did they slip through
> quanity control?
>

I am not sure that anything was wrong with the chip. Previous posts on the
topic indicate
that it has the same part number as the original ST DMA chip, so I suspect
that some of the support circuitry had a minor timing problem, and the
easiest way
to fix it was to update the DMA chip.

I expect that the real problem was that a designer somewhere did not take
proper account of
"product spread". That is whilst every chip specification has a quoted
"typical" value,
say "input current 5 milliamps" they also have a tolerence (plus or munus 1
milliamp)

So foe example in order to drive such a chip , one with 5 Millamp output is
no good. because
that will probably have a similar spread, 5 +/- 1, instead you need one with
7 ma
of drive then worst case spreads will work.

I guess that in the case of a machine like an STE calculating these worst
case senarios is not easy
and one slipped through, or that one batch of DMA chips was close to the
edge...

I don;t think any one who knows the real answer would let on...

I have a copy I won as the prize in that survey some one posted about 2
months ago
(was I the only one who completed it)? I will try and have a go at getting
it running this
weekend and let you all know what I think. I must admit I am not very
familiar with
ST Score Edit programs. When I need to Score Edit (which is not often) I
usually
use "Noteworthy" on my PC, which I must say seems to gain an extra
limitation every time
I use it.....

Dave

Well it apears to run and load the music provided, and from what I can
gather from my limited knolwedge of German it should allow editing
and printing with Speed GDOS. BUT its all in German and music editing
programs are hard enough work without being in a language of which I have
only a limited understanding....

Hello Ken :-)

> What is the most current version of Cubase available for Atari Falcon?
> Is there a score editor that allows you to use vector fonts?

On a Falcon you can use :

- Cubase 3.10 (MIDI)
Score Edit (3.0) available and external module can be used (Studio Module,
Cue Trax, Style Trax)
- Cubase Score 2.0r6 (MIDI)
Score Edit available (3.5) and external module can be used (Studio Module,
Cue Trax, Style Trax)
- Cubase Audio 2.06 (MIDI and Audio)
Score Edit available (3.5) and external module can be used (Studio Module,
Cue Trax, Style Trax)

Go to http://music-atari.org/music/cubase/ for more ...

> Is an English Demo Available?

No...

There is only Cubase Lite, but it run only on ST(f/e) Mega ST(e) ...

Clearing out the attic I discovered an Atari SM124 monitor, complete with leads. If this is of any use to anyone I would be happy to donate it to a good home. You collect - I live in Sussex. Otherwise it goes down the dump.

Thanks

Ralph

Hello,

If you can't find back BBS st and have more than 1 meg of ram, you may want to try Strabox from the Starcall suite : it allow to use 4 s�rial ports in the same time.
The shareware fee is very small (15$).

I unpacked them using the latest version of unzip for mint.
I got a warning message telling me what was wrong with the files, and it even mentioned ST-Zip as a possible cause of this error. But the program was intelligent enough to correct this error and unpack the files without problems. :-)

3082. MagiC 6.2 upgrade from cracked 6.1 beta

Newsgroup: comp.sys.atari.st
Date: 2002-04-07 18:01:18 UTC
From: Kenneth Medin <kennethm@tripnet.se>
Message-ID: <3cb0976c70f2150@tripnet.se>
Source record: 36083

Finally I got a legitim copy of the latest MagiC 6.2 and installed it a couple of days ago.

I have been using the cracked 6.1 beta for evaluation reasons for some time now and have had quite a few problems with it. Sudden hard crasches especially when launching programs like Qed, CAB etc. Also CAB 2.8 used to exit with some bombs now and then.

Not a stable setup at all and as I have seen some of these behaviours happen when running the same things under Geneva+Neodesk I began to sort of not really trust my Atari like I did in the past... Despite this i took a chance and finally bought the latest Magic which fortunately turned out a success.

Now I have used it very heavilly for two days running MagiC 6.2+Jinnee2.5 and not a single glitch or bombs or anything. Everything works perfect!

I have mostly been surfing with CAB, reading/writing with Okami+Qed+Popwatch+Newswatch etc. Sofar I have receieved 8 MB and transmitted 2.8 MB today over Modem 2 running STinG. I just exited CAB for the first time today and got 10 MB RAM back (using 4 MB image cache), so it does use up some memory.

I also tried to let Phplayer play MIDI-files through the internal speaker while surfing with CAB and letting Okami expire news at the same time and everything worked perfectly. The 1:st movement from Beethoven's 5:th symphony at the Score Perfect site was to much for Phplayer to handle with good sound but nothing went wrong with the computer or the programs running.

So, my conclusion is that those of you who still use this MagiC 6.1 beta really should consider upgrading to the "real thing". The difference is very significant!

This is on a TT with 32+4 MB RAM and a Sektrum 1 TC graphics card at 256 colours and 1024*768. HDDriver 8, NVDI 5.

The only strange thing now is that I can not print via NVDI or That's Write running MagiC on this computer. The printer port looses characters resulting in garbage. The very same setup with NVDI 4 on another TT prints perfect. Unfortunately I switched computers and NVDI version at the same time so it is hard to tell where the fault is.

Actually no. I just happend to buy _two_ copies of HDDriver at the Nordic
Atari Show in Malmï¿½ last june. The seller was 16/32 Systems. I also got
NVDI5 from him at the same time. Unfortunatelly he had no MagiC versions
to sell at the time.

I will mail you right away the serial number.

To completely ruin your worst thoughts I actually bought two copies of
MagiC 6.2 too from Indigo2 in Denmark some time ago. The reason for this
is that I maintain the computer for a friend of mine who is a Atari
user and use the computer for much of his work at the Gothenburg
university. My task is to keep his TT up and going as he is not too
interested in computer secrets. He also uses Okami for all his email uses
and this mostly works fine although he does some strange things now and
then...

You can check his website with some CD's from his record company Musica
Rediviva at http://www8.tripnet.se/~sb/ and off course all the CD
booklets are made with Calamus... There are a couple of more CD's out
that are not put up on the site, though.

Sounds like a problem with busy line. I think only good printer
drivers used interupts on this line. MFP or YM could be at
fault then I think.

Kenneth,

MagiC 6.2 offers some software incompatibility that you might see in a
little bit of time. Of course that might be Falcon specifc or even
specific to MY falcon. All I know is MagiC has always been stable for me
so I think everyone else who has MagiC + Falcon problems is a little crazy
;-)

I think I've just reconsidered my decision to buy HDDriver and will
continue using CBHD.... heh.. It's like salem witch trials around here.
I can understand there being somewhat of a suspicious nature about people
saying they are using your commercial software, but the accusatory nature
of your responses to things (Uwe) are far uncalled for. Many people have
copies of HD-Driver through perfectly legitimate methods that might not
result in them being in your database. Not everybody is a fucking criminal
by default. And it sure sounds like he was using cracked software only
because of an inability to PURCHASE software. Something the Atari
community feels all too well. In a whole I would tend to believe the Atari
community is the most honest "group" of computer users period. You

probably have a higher percentage of users vs. legal users than most software products on the market. I for one have never registered software in the aspect of filling out a registration card and mailing it. And mostly I will buy from 3rd party dealers and shows. Obviously that's wrong.

Mark

3090. Software Registration

Newsgroup: comp.sys.atari.st
Date: 2002-04-07 21:38:53 UTC
From: Mark Duckworth <mduckworth@antii-spam.atari-source.com>
Message-ID: <1018215357.198721@pikachu>
Source record: 36091

I've noticed some things around in the Atari community lately that bother me. Software authors think customers should somehow get their elbows up their butt in order to use their software and I don't think it's fair. Most atari products are created somewhere that the people who want to use it aren't. Most of the time, it's rather difficult to register or legitimately purchase their software. For example, on ASH's homepage which is compeltely german, they have an online shopping area where people can buy their Atari products, which have been updated frighteningly less frequently.

If I ever used commercial software illegally, it tended to be to evaluate the software for a reasonable period of time. I mean most people would actually want to use something for a month or two to see if they will run into strange problems before spending $100+ USD on it. Contrary to what some people in other countries believe, in the US money does NOT grow on trees. I wish it did. I would also use a commercial product in the interest of translating it to English and spreading the English resource files, which in the end benefits the author.

Let's talk about ease of registration.

I emailed bengy who started up shareware.org, a GREAT idea in order to purchase quite a few software packages which I want to use legitimately on a regular basis. It's been several weeks and I still haven't received a reply to my email.

I'm not saying it's right to pirate software. I'm not saying it's right to use software without paying for it simply because it's a little difficult to register. But when software authors almost seemingly purposefully make their software difficult to register, have pages and software in other languages and everything else, provide no support and aren't active in the atari community, why should you have to pay for it?

If you're going to sell something, support it. Offer a free copy to people willing to translate it. Offer a free copy to beta testers. Use paypal if you can or some auction payment system. The easier you make it on customers, and the KINDER you are, the more people will buy your software. Strongarm tactics of registration database control and complete insincerity with the notion that people might purchase your software through atari dealers is silly. There's no reason people should pay for an abandoned dead end project like CAB. It should be released to the community and the author should chalk it off as a loss or a good deed. Not as if they would get any more money for it anyway. CAB sucks anyway, highwire will be cool.

GNU software is obviously what the Atari community needs. Look at what it has done for the PC world. Look at what it is doing for atari projects

like QED, and Octopus. If a project is maintained, sure, closed source and costs money.

I don't even know where I'm driving with this, but I want to pay for my software, but sometimes it's damn impossible or rediculously expensive. What is Calamus like near $1000? Alright fine, I simply won't use it.

I would suggest others do the same thing. For each pay product out there, chances are there's a free product that's as good or better.

I believe harshness often goes hand in hand with perfection. So, that is
a prize we have to pay for using his excellent software. And, I really
prefer perfection compared to nice manners lacking genuine substance.

If you don't get any takers, you might try selling it on eBay rather
than throw it away. I'm sure that'd be far better for everybody than
sending it to a landfill.

I well remember the dismay some felt for the Falcon. If it would have been a 32Mhz machine with an 800x600x16 color mode, I think it would have sold much better. Too many "power" Atari users were hoping for more than what the Falcon was, and it also cost quite a pretty penny -- on par with Macs of similar capability.

> can you imagine how the morale of the Tempest
> developers must be right now?
The Tempest has two distributors as far as I know. One, Cortex Designs, has had a few unhappy customers. The other, Frontier Systems, has no indication on the English part of their website that the card is even available. This rather discourages purchasers. In addition, the Tempest card requires fVDI, which is not nearly as popular as NVDI. I'd love a graphics card, but I'm not willing to make my machine unstable to get a higher resolution.

Hi Mark,

>Contrary to what some people in other countries believe, in the US money does
>NOT grow on trees

Nor in Europe

>Offer a free copy to people willing to translate it. Offer a free copy to beta
>testers

I agree, and I advice to offer a FULL version to b>ta testers ; I do b>tatests on Had>s60 for some powerfull programmers, 99 % sent me normal full versions to b>tatest, but one asked me for doing that on a version that can't save. It didn't bother about making me to rebuild all the sc>ne and reset all the settings of the programm before starting that modeler and the raytracer and getting >illegal instruction in ...>.
I was sorry about abandonning this great programm, but I stopped to help that project..

>CAB sucks anyway, highwire will be cool.

I'm shoked : it was not that bad.
What programm did you made ? Was is bug free ?

>software, but sometimes it's damn impossible or rediculously expensive.

I agree, I think that a 5$ or 10$ note in an enveloppe stay the cheaper and the easyest way to give money, even if it's the most risky one.

Some words about the lack of English versions : in Europe we're obliged to learn 1, or sometimes 2, foreign language (and always English). English is necessary now, but you'll not be surprised that I would prefer 1 or 2 centuries back when French was the international language (-;
In Am>rica, which foreign language are you obliged to learn at school ?

Our team is making a game, and instead of making only an English version we're trying to make more, and versions will be released regarding the feed back we got. Well you can be sure that one of the first releases will be Polish because only 3 Am>rican people showed any interest in the game ...
Feed back is needed for any software, many projects are abandonned because people enjoy silently when complaining loudly.

Think again

Regards everybody

I'm not sure where you are headed either, however some parts of what you
said hit home. For example, one day I finally broke down and decided to
purchase the only ethernet driver available for the Hades. I tracked down
the author, he refused to send it to me, even refused cash and told me I had
to order it from some dealer. That's all fine and dandy, but what dealer
did he direct me to? Well, one that never returned a single e-mail
months before when I tried to order a ribel card for me TT.

What to do? Well I waited for another driver to come along. ;-P

sigh.

Great software yes, Worth whatever he wants to charge for it yes. Not
manners-free software. Imagine if a reputable company did this? Look at
how people have reacted in similar situations? Nobody wants to feel like a
criminal, except a real criminal ;->

Octopus can now get characters from the terminal making it more or less a useable product. But I forgot to actually write stuff to handle the telnet protocol! There's a Network virtual terminal that needs to be able to do negotiations with the client. I uhh.. I forgot about that part ;-P

I don't know if it's the same one but at one time there was a browser called
Mosaic available for Windows, I had it running under Windows 3.1 many moons
ago, as I recall it functioned ok but I can't remember how large it was.

Yep, patched it as you did but still no go :-(

Seems to be something network-related, since the error message "Cannot
resolve host" changes to "Cannot open service port" if I enter the dotted IP
address instead of the actual ftp site's address.

Cheers

Clarity16 will do it though it is a bit arcane to use, I believe
Wavemastger will do it, adn I know that Audiotrack will , though it's a
bit of a sledgehammer/nut situation to use for just stereo...You will
need a 44KHz cart fopr all of these, though Clarity has one built into
its dongle.

Did you use the new MAGIC.INF file from the "Extras" folder, or simply use
your original version? I'm thinking that your problem might come from using
the new features of Magic 6.20.

I must say that I don't have a clue though how these features might be used
though!

I guess you've also tried switching to foreground printing in the NVDI
printer CPX?

Cheers

>software, but sometimes it's damn impossible or rediculously expensive.
>What is Calamus like near $1000? Alright fine, I simply won't use it.
>

I agree with most of what you say, but you should lay off the Calamus
people. Their software is unbelievably expensive, but for a good
reason: it's truly professional software. Full versions of modern
Calamus are professional publishing tools. For us poor home users
they actually offer and sell a lite version that onloy costs around
US$ 50, which is very cheap for what you get. And Calaums is actually
very good compared to other software about how to purchase it. You
can buy it directly, in english, off their website or you can purhase
a registration key through Europe Shareware. I personally find it
amazing that they support the TOS platform.

About what you say about GNU software, I'm not sure that the Atari
community should rely solely on it. There are many disadvantages to
the open source model. I've actually read arguments against it
because it tends to very badly hurt competition. I guess the argument
is that if something similar (not necessarily better) exists for free
people woll always refuse to pay a dime for something equally as good,
eliminating competition. Strange argument indeed, but I would, as
most people probably agree, like to see at least a couple healthy
commercial software houses survive.

MD> rather redundant as the atari can use pc disks directly. ;-)

Yes I also tryed this sometimes, that is connecting the PC on the Atari SCSI chain (done also with Mac), the important thing is to keep the PC (or the Mac) "locked", you have to switch it on to make drives spin, but the OS must not start (BIOS or shutdown screen) to be sure you will not have concurrent access.

Very useful to share a CDwriter that is inside your PC or similar scsi devices.

Converting AVR to WAV files is just a matter of a mouseclick with Aniplayer:
http://aniplay.atari.org , another solution is treat yourself to a better CD-
Writer package, SoundPools Audio Recorder Pro has no problems with AVR files
and as an additional bonus produces real Audio CD's which are conform with
the red book protocol. You can even use the program to produce a master...
http://www.soundpool.de

Cheers from Belgium
Dennis

Hello there,

is there any chance that my Atari Mega ST will start a program
automatically after power up/reset? Didn't find any settings at
desktop. The best thing that I could get was that the Atari opened
the drive in which my binary is in.

Thanks a lot in advance!

bye
Chris...

Depends on what kind of program you want to run and TOS version.

The AUTO-folder lets you run a number of programs at startup. They can't use GEM (mouse/windows) and are generally certain utilities like AUTOEXC.BAT in MS-DOS.

Programs with the extender .ACC in the root directory will start on boot and can then be accessed from the leftmost menu.

From TOS 1.4 and up you can set one normal GEM application (.PRG) to start automatic. I seem to recall that you single click on the program and select the menu "Install application" (my TOS is in Swedish) followed by the "Auto" button to get this function. Don't forget to "Save desktop" before you reset the computer.

Your Mega ST will normally have TOS 1.2 (without this feature) or TOS 1.4.

There are lots of other ways to launch programs on startup by third party OS'es etc. but this is the basic concept with only the built in OS.

That was kind of why I defended the NOVA ATI cards. A few years ago,
several authors, including Computerinsel, released rock solid versions
of their software to include compatibility with the Afterburner/NOVA
combo. I for one was please to no end, and felt that part of the
(huge) amount of monies spent on the Nova adapter and drivers were
well spent for the support offered across the board. Black Scorpion,
Uwe, Computerinsel, Anodyne Software, Woller, ASH, HOMA House, Gizzmo,
and Wizztronics (and many other single users) all were very helpful
when it came to compatibility issues with new Falcon hardware, and
their support is still appreciated to this day. NOVA and NVDI
performance is flawless on this users Falcon.
Hell, i'm happy, even if I don't know any better!
Mike

It did happen with 6.10 too on this TT but works on another TT with
NVDI4. I suspect a hardware fault as the Yamaha chip has been replaced at
some time. The solering looks a bit messy. As I have another TT I could
rather easy check this by simply switching harddisks. A bit strange
though that I can print with NVDI5 and Geneva or TOS.

That's Write does not use NVDI for rendering text but shows the same
symphtoms. Also When I try the IPRN demo, data travels extremely fast to
the printer but the printer itself does not seem to receive anything.
Could be a handshake problem?

Standard text printout works perfect (without IPRN) when using a standard
text editor.

>I guess you've also tried switching to foreground printing in the NVDI

Yes. All settings looks OK afaik.

Being a former Atarian I remember their being a lot of different TOS compatible operating systems kicking about. However I am kean to know what ones are currently still available and also who owns the rights to TOS, GEM and MiNT (I seem to remember that was Opensource?).

Anyway any help appriated.

Kind regards,

Rod

He has been very reliable over the years and is a genuine Atari fan.
There is a special Atari pricelist on his site but it does seem to need
some updates. Best to mail him to check what he can deliver.

>I'm in your neighbouring country and it would be nice to buy an upgrade
>without having to go to far away.

Yepp and both Swedish and Norvegian customers can pay in advance. He has
acounts both in Sweden (postgirokonto) and Norway so it's really easy
without need for abroad money transfers.

As you are interested in music you might find quite a few items at his
site.

Jeff,

I agree with you 100% on Calamus. I didn't mean to insult them or knock them, just that the full version of Calamus is rather expensive for a home user to afford. I do not know though what the lite version is missing that the full version has? Might be interesting to look into it :)

I agree with you. When you can not support a software, just offer a free
version, that's the way most companies do.
The software is already written, if the author feels not enought money
was made while it was still a "hot" product. That certainly is not gonna
happen years after the "death" of the project.
This applies in my opinion to CAB and the likes.
As far as HDDRIVER, Uwe still works on it, he provides help on newsgroups,
works with other developers (hard/software), direct contact with users etc
etc.
This is a still very active project, Uwe deserves the money.

Just my 2 cents worth.

Jess,

You dont need a Multitasking TOS but PARCP is compatiable with that type of OS. I used PARCP on my TT030 and my PC. I used a 25 pin cable and cut it in half then spliced it back together with the wires swapped that needed to be swapped. Work great.

Don

I was using the lite version for a while. It actually has just about
everything you'd want. The only restriction is that modules cannot be
added beyond what is included with the lite version. As far as I
could tell, lite came with most things you'd want for basic desktop
publishing, including just about every import filter you'd want,
including truetyp font importers. The system doesn't come with the
high-profile modules like Bridge 5 or others that might be useful for
creating electronic documents. The great thing is that one can add
printer drivers to the lite version. I was using an SLM driver with
the lite version that originally came from the demo of the full
version.

I strongly suggest buying it if you're interested in Calamus. It's a
great package for very little money. I considered using it as a
replacement for doing presentation work (which is not quite its
purpose), replacing Powerpoint and Corel Presentations on my PC
because it really was far better even at presentation printing. But,
alas, since I got my Galaxy graphics card on my TT, I can't run it
since the Galaxy only works in 16-bit color mode, which Calamus will
not support. Although I don't beleive it works with any cards
requiring fVDI. But that should change soon.

Thanks everyone for your suggestions. The previous suggestion of the 525
program did the trick for the conversion. I'm working on registering
Aniplayer, but I haven't tried it for this purpose.

What is the best solution for multitrack audio recording? Soundpool?
Cubase Audio? Other software/hardware? I'd like to get into this with my
Falcon, but I don't want to have to mortgage the house to do it. What's
the most common hardware/software setup for multitrack recording?

In this case they should simply send me an e-mail and register.
Unfortunately there are more and more users using illegal copies of my
software. It's legitimate if I ask users that are not yet registered for
their serial number. Every copy that was obtained by legal means has a
serial number.

> version, that's the way most companies do.

Note that there are also models where the software and the sources are
completely free for non-commercial use (including some support in
mailing lists) but not free for non-commercial use. I have worked for
years for a company that was using this kind of model. We were *very*
successful with it. It was not a problem that commercial users would not
pay for our software because they could get the sources for free anyway.
Commercial companies depend a lot on excellent support and they will pay
for it. But it must really be fast and excellent.
We had no problems competing with Open Source software and there was a
lot of Open Source software competing with our products.

No.

After MiNT went opensource, the FreeMiNT project was born. FreeMiNT is
updated and patched, and a lot better MiNT.

SpareMiNT is a bunch of software, distribution (just like RedHat, Mandrake)
that use RPM packaging system, nothing more.

All I can say is...
I've also lived with the frustrations.
The good and the bad of owning an Atari.

I currently own and use two, and over my lifetime I've had 8 Ataris.

The realisum is that Atari is now days mostly a hobby machine.
People use them because they enjoy them...when they have time for it.
That's the main reason I've kept mine...
Yes, I'll promptly agree that alot of people do REAL work wit Atari,
but with
all the low cost alternatives out there these days...I can't help but
believe
it's mostly a matter of heart. $400 for a video card...$200 for a PCI
bridge
that 'might' work if you breathe right...vs a pretty complete ultra
modern PC set up for $600 or less. Yep, it's a matter of heart.

We're pretty lucky if and when someone gets the urge to complete a
major project for these old machines and share it in any form at all.
Free, paid, or otherwise.

Obviously it means more to some people than to others...but lets look
at the facts.

Part of the fun of Atari has always been the round about nature of the
user base, and the various personalities involved. Even knowing the
name of the author of a particular piece of software is something that
is becoming altogether rare in this day and age. If nothing else...
Atari is a Saga of 'hope'. "Support" has NEVER been a strong suit
in the Atari world. Usually just a lot of consoling, and hoping.
Almost since day one...Atari personal computing has been a lot of
little
one man shops eeking out a meager existance. The early bailing out of
countless ST dealers worldwide speaks for itself. Weak support...

I think about Atari History...
Things like the story of Dave Small and his Mac emulator...
The FCC hold up on the TT...
Gobs of stories cross my mind...far to many to mention...

It's definately a long lived Saga. And I think that's what keeps
alot of us hanging around. Atari just doesn't die simply because
a hand full of people keep it alive with hope...simply because
they enjoy it.

I could be wrong, but I highly doubt Rodolphe will do much more than recover
the costs of his CT projects...he might even lose money when it's all said and
done. I doubt Uwe is rolling in money for his HD-Driver software, and I
doubt that he ever EXPECTED to. It seems to me by choosing to share their
work with the public at all, the best they can realisticly gain is some
funding for a very interesting hobby. Please don't mistake my use of the
word 'hobby' as insulting. I think it's a FINE thing. It's just obvious
to me that few atari developers with any scruples about them do this
for profit.

With that in mind...
We simply have to realize who is in control and live with it.
If you want Uwe's software, then you have to get it his way and order
it from a place in his chosen distribution channels.
If you want N.AES, or a CT2 and you live in the USA, then you'll
simply have to jump through the hoops of ordering over seas, or find
someone who enjoys that sort of thing to do it for you.

That's exactly why a good portion of us have kept our Atari machines running
all these years. We actually ADMIRE that way of doing things. It's more
personal than some shinny corprate Logo on hand at Wally World that was
thought up by a nameless stranger.

While I appreciate the prodding efforts to get individuals to share their
work, and make it more 'convienient' for the end user. We have to remember
that it's not always as simple as uploading it to some server somewhere
and forgetting about it. There might be contracts involved or, a for
instance...If someone wrote a piece of software that WRITES GIF
files...royalties might be due to Compuserve for every copy
distributed. Back when the author was still having the software
distributed, by whatever means...SOMEONE was taking care of this legal
work...be it the author himself, or a third party (such as a software
house). Other examples might be cryptology technolgies that might
only be legal in certian places.
Such software would have to be stripped of any possible patent or law
enfringing code, or...someone would have to keep the books on it up to
date. Sometimes it's just not worth it anymore for an individual to
worry about it...when they want to cut the leash...they just cut it.
Hudge suites of

software such as Calimus are a prime example. It potentially deals
with
so many patented technologies that it wouldn't suprise me if a 3rd the
cost
of the software doesn't go to pay royalties. Some of it can be so
subtle the
author himself doesn't realize a feature touches on a utility patent.
Would you release this code without okay from a fleet of international
lawyers? Even if you never intended to distribute it again...ya might
think twice about it ;)

I'm all for encouraging orphaned software to be released. I'm all for
healthy dialog about what users want to see developed. I'm all for
wish lists
and constructive efforts to prod developers to add or change things
about their work. This is all one of the fun things about Atari;
however, I urge caution in
insulting attacks to the people that are today's Atari. In the
end...if
it gets done...it's because they WANT to do it, and in today's crazy
busy complex sue happy world, if they choose to share it with you at
all...you're fortunate.

May the music be with you,
Brian

It's easier to get a cable where the plug shells can be opened (ie not
moulded). Just swap the position of two wires in ONE plug! ;-)

You are absolutely right and I do not know anybody who really earns money with software for Atari computers. This was possible some years ago, but it has been several years now that the market is simply too small for that. Those that are still writing/supporting software do this mainly because they have fun doing it and/or because they do not want to disappoint the users of their software by stopping the development.

> If you want Uwe's software, then you have to get it his way and order
> it from a place in his chosen distribution channels.

The distribution channels for my software have hardly changed. With much more Atari users connected to the Internet than some years ago certain things have actually become easier. It's normal now that *registered* users can receive updates by e-mail. The only remaining problem is payment from abroad, which can usually only be done in cash because the bank fees are higher than the actual update fee. This is the reason why paying in cash is required. But at least in Europe this it has become easier with the introduction of the Euro.

Guys....please read the original post....he said RECORD, not
CONVERT.....

Sheesh....rant mode off...

CAF is OTT if you just want multi-track audio...Audiotracker is fairly
easy to use once you get used to it eating up a partition ....which CAF
does anyway so no worries there....basically it adds its own format to
what's already there, making it appear as one enormous file....doesnt'
have to be the whole partition though...adn it doesn't liek big
partitions either so get rid of BigDOS/Magic/MINT on this....
There are other ones out there ....Quincy, Devil Studio but I don't know
them so well...I've done a fair amount of recording both stereo and
multi-track with AUdioTracker into CDRecorder adn it always went
well....big disks are good though....half a gig for the original audio
recording, half a gig for the .AVR or .WAV file 9doesn't matter which)
and then another half a gig for the CD image.....

hi!
Well: the freeMiNT distribution have rpm possibility too
with rpm, our "unix like"operating system is compl te.
The sparemint help you to install the right thing at the right place:-), it
is faster than to do all the job by finger thru "console"+compilation:-)
It still exist too "easyMiNT", a special rpm for install all you
need to begin too:-)
It is completly diff rent from "linux red hat rpm or mandrake debian", mint
it is only for atari user".
If you really need linux, it still exist "linux 68k, debian, and red hat non
official adaptation for atari too"
bye

FreeMiNT is not A DISTRIBUTION! FreeMiNT is a GEMDOS compatibile kernel
based pn MiNT code.

> with rpm, our "unix like"operating system is compli¿½te.

SpareMiNT is a DISTRIBUTION and can be very close compared to RedHat Linux
or Mandrake Linux - Linux is a kernel, and RedHat (or Mandrake) is software

The only thing SpareMiNT is missing is instalation, i.e. there is not
special progam to do this, and you have to do everytcvhing on your own.

I just wondered if it would be possible to update the Falcon TOS to the one used in Milan machines? Is it compatible (or has Falcon HW support been dropped in favour of Milan's)? Is the upgrade free if you own a Falcon? If yes I guess it could even be burned on an EPROM! :-)

Were some WinX and/or TOS-Patch patches included into Milan-TOS BTW?

Not actually true... despites the Euro, banks fees are prohibitive!
For example, I would have had to pay Eur 8 to send to you the amount
for upgrading to v8.11, which is only Eur 10!
If I had sent a cheque to you, you bank would have charged something
like Eur 5, and so would have mine. So, I think the Euro doesn't make
it easier to pay abroad - unless you can travel to the country.

Yes, but EasyMiNT is a distribution based on SpareMiNT. It isn't SpareMiNT
installer. Ie, you cannot grab SpareMiNT paskages and EasyMiNT and install,
you have to use special EasyMiNT packages.

KGMD is to old to even mention. It has nothing in common with SpareMiNT,
except that is is a distribution.

Agree. I made a 28 page CD booklet with the Lite version during the
tryout period (30 days) and I am very satisfied with it. No bugs showed
up at all during the work.

I did have some problems when printing from my TT but there seems to be
something wrong with the computer as other programs show the same
sympthoms.

Runned it both on a 36 MB TT and on a Windows pc and it is _exactly_ the
same code (emulated in Win) so compatibility is 100 %.

>including truetyp font importers. The system doesn't come with the

3164. Joystick Problems...

Newsgroup: comp.sys.atari.st
Date: 2002-04-09 18:30:38 UTC
From: NightRaven <Leysin@hotmail.com>
Message-ID: <irGs8.2508$dm4.56853@news2.ulv.nextra.no>
Source record: 36015

This might be a bit mundane question to ask here,
but....
I recentely accquired a Competion Pro 5000 joystick
from an auction on ebay. I'm not sure if it was new or
not, the auction was held by an joystickcompany and
it came in the original package, but there was scratches
on the base.
Now, the thing is, I used to have a joystick exactly like
this. But the stick on the joystick I bought now seems
to be almost stuck! It works, but I have to push reaaly hard,
and I can not remember this joystick to behave like this.

Is there something I can do about this?
I have a suspicion that it might have something to do
with the rubber inside the shaft.

Many thanks for any answers regarding this problem.

- NightRaven

Just getting started, are you ?

Look for the following programs, and don't forget to read the manuals,
readme files etc. :

HSMODEM
STIK2
QDIALER
CAB.OVL for STiK
CAB

You will find all this on http://www.flinny.demon.co.uk/download.html

The CAB you'll find there is version 1.5. A better idea is to get the
CAB 2.8 demo from http://application-systems.de/produktefuratari/

If you're used to Explorer, don't expect miracles - but it is possible to
go on the internet, even with a modest STf.

3170. Popwatch chokes on bad mail

Newsgroup: comp.sys.atari.st
Date: 2002-04-09 19:28:09 UTC
From: Kenneth Medin <kennethm@tripnet.se>
Message-ID: <3cb34ec625aa3d0@tripnet.se>
Source record: 36020

Got a spam email today that made my mailbox unaccessible with Popwatch.
It simply exited with an "An unexpected error has occured" right at the
point when the mails are displyed in the Popwatch window.

I have used Popwatch for several years and never had this problem until
now. And I do get a lot of spam as I have used the same email address for
6 years by now...

I solved the dilemma by fetching it with Pine instead and delete it on
the server. I have put the offending mail at

http://atari.mine.nu/badmail.txt

I have not checked if the strange charcters in the header or the fact
that the message is one single mega long line made Popwatch choke. Under
MagiC I also got a message to the console that some memory blocks got
overwritten but MagiC did not crasch. With TOS 3.6 however only the
Popwatch error message showed up before it quit. Fortunately Popwatch did
exit the pop3 mailbox properly so I did not have to wait for my isp to
timeout.

Hm, can I rename my .PRG file to .ACC to get this done?

> From TOS 1.4 and up you can set one normal GEM application (.PRG) to
> start automatic. I seem to recall that you single click on the program
> and select the menu "Install application" (my TOS is in Swedish) followed
> by the "Auto" button to get this function. Don't forget to "Save desktop"
> before you reset the computer.

How can I determine which version of TOS I have? But I guess it is
1.2, since I cannot find the Auto button. But I have "Install
application" with the choice of GEM, TOS, and TOS with parameters.
Unfortunately GEM didn't work :(Do I have to change the file type
field? I was trying to set it to .PRG, but also didn't work. When
looking at desktop.inf I can see that my programm is in there, but
when I reset my machine (after having saved my desktop), nothing will
happen.

> There are lots of other ways to launch programs on startup by third party
> OS'es etc. but this is the basic concept with only the built in OS.

The disk I'm using is hopelessly full and all files on it are needed,
so an additional utility might not help in this case :(

You would likely be outbid. The last three Falcons I saw all went for
over $300. I bought one a few months ago (4 MB w/HD) for $350.

I agree the price is high, but you are buying audio equipment that
just happens to be a computer.

It existed at some point in time. The ST Pad was driven by a stylus.
I believe Atari licensed some software from a company in Russia.
I have no idea if this software ever actually existed outside of the ROM on
the ST Pad.

If you want to have only a "multitasking" desktop you do not need to
reinstall nothing. YOu just need FreeMINt (the OS kernel) and AES (Xaaes, or
AES 4.1 or commercial N.Aes)

But if you want to use unix tools or have internet connection with it, you
will have to repartition your harddisk and create ext2 partition (you can
also create minix partition but minix is obsolete)

About compability: FreeMiNT is compatibile with all properly written
programs, ie. that use system calls instead of grabbing vectors, etc.

Btw. YOu cannot "lose" TOS as it is in ROM, and FreeMiNT is replacement for
MiNT in MultiTOS (ie. FreeMiNT+AES=MultiTOS)

Mostly not as they have to be written in a rather special way to allow
this.
>
>> From TOS 1.4 and up you can set one normal GEM application (.PRG) to
>> start automatic. I seem to recall that you single click on the program

>How can I determine which version of TOS I have? But I guess it is

If the "youngest" date is 1987 then you have TOS 1.2

>1.2, since I cannot find the Auto button. But I have "Install
>application" with the choice of GEM, TOS, and TOS with parameters.
>Unfortunately GEM didn't work :(Do I have to change the file type
>field? I was trying to set it to .PRG, but also didn't work. When

This will not work. If you install a word processor like 1st Word+ by
using "Install Application" on the program icon and set the document type
to "DOC" then whenever you double click on a *.DOC _document_ icon the
installed application will start _and_ load the ducument in one go.

>> There are lots of other ways to launch programs on startup by third party
>> OS'es etc. but this is the basic concept with only the built in OS.
>
>The disk I'm using is hopelessly full and all files on it are needed,
>so an additional utility might not help in this case :(

Actually it may be the other way round! check out the PFX_AFX package
from Ulf Andersson's page at:

http://www.ettnet.se/~dlanor/

You can both pack programs _and_ data files. But remember to keep backups
as disk compression makes things more complicated and can result in data
loss. I have used this myself many years ago without any problems. First
try to use compressed program files and if you need more space then add
datafile compression too. As floppies are rather slow this will also
speed up the overall loading speed.

And off course you can format the floppy to more than 9 sectors and 80
tracks. Up to 11 sectors and 82 tracks often works well.

I have a new STe and an 8-bit XEGS both with composite out.

The XEGS has much better graphics output than does the STe. I used ultima 3 as the reference.

The XEGS is far sharper and well defined, unlike the STe which appears a bit fuzzy.

No one has been abe to help me find something that can convert the Atari ST best electronics 15.75khz VGA cable signal into a 31.5khz signal for use on 640x480 compatible VGA monitors. I want the ST ultima on my 36" VGA TV looking as sharp as possible!!!!!!!!!!

You can get external scandoublers meant for the Amiga which do just that (convert 15khz up to 31Khz for use on SVGA monitors). I dont know very much about the ST's video-out It shouldnt be too hard to convert one of these for use with an ST.

Cheers,
kfb

Uwe,

Make no mistake I absolutely admire your work and feel that you should get every cent for it. And as such, I have nothing but the utmost respect for you. I just feel like every time HD-Driver is even mentioned, you have an auto-responder that magically says that same craftily worded statement. Usually you're respectful when asking such a question but I felt in this time you were simply accusatory. This to a guy who honestly stated his

intentions and history and his (also admirable) intentions to purchase the software that he was using illegally.

In the end, you are probably one of the best developers with your excellent support history and fantastic products which are regularly updated. The last thing I wanted to do was insult your programming skill or even you as a person. I really just wanted to vent about software developers and piracy witchhunts in general as I have been feeling it lately from all angles. In fact you are responsible for maybe 1% of that e-mail. It was intended to address my disatisfaction with an assortment of issues including the fact that other atari authors hold onto their software which they are unwilling to support and at times even accept money for.

I realize I might have expressed more concern onto that specific example that I had in front then I should have.

I'd like to take this chance to apologize to you directly. I've been meaning to purchase HD-Driver and I still intend to do so despite what I've said. I would like to purchase a mass amount of software so I can pull it from my budget in one lump sum, but other authors/organizations are highly uncooperative (how silly is that) to the point where I almost have to start doing this in completely separate transactions. How much is it to ask for US based authors to accept paypal? I don't think it's much and it greatly eases my troubles. I don't have a credit card, and I probably won't have one for a while. Life throws curveballs sometimes and a messed up credit history is all you have left ;-)

So in closing I again say that I have nothing but the utmost respect for your programming talents and your admirable contributions like outside to the community. Please don't let anything I've said but please at least take into my consideration to not let a few bad apples in a group of loyal supporters (or at least WANT to be loyal supporters but just can't afford it and resort to AHDI) spoil your general demeanor.

Hope I didn't cause any bad blood,
Mark

You are right and I should have been more precise: I wanted to point out that the Euro also makes things easier with respect to software updates because the payment from most European countries can now be made by Euros *in cash* without any bank fees. Before the Euro users were forced to get Deutsch Marks when ordering an update from me, i.e. they were forced to pay the banks in any case.

You need CD writer software either from SoundPool or from Anodyne in
order to write data to CDs or CD-RWs.

> Can I use the cd rw like a regular hard drive (make partitions ,run
> programs)?

No, you cannot create partitions on a CD. The mechanisms are different
compared with hard disk drives and should be explained in the manuals
provided with the CD writer software.

Oh, you should have a closer look at the Atari newsgroups and
discussions where my software is involved. It's an exception to the rule
that I'm asking for a registration. I'm just not willing to spend my
time on users with illegal copies. I could just stop writing in
newsgroups and only give support by e-mail to users that give me their
registration number. This is what a lot of firms usually do, but is it
really better?

> Usually you're respectful when asking such a question but I felt in this
> time you were simply accusatory. This to a guy who honestly stated his

But he was using software illegally, wasn't he? So the question was
justified.

> doing this in completely separate transactions. How much is it to ask for
> US based authors to accept paypal? I don't think it's much and it greatly
> eases my troubles. I don't have a credit card, and I probably won't have

> history is all you have left ;-)

I don't know paypal. But note that at least in Europe accepting any form
of non-cash payment from abroad is simply impossible for private
persons. You need certain equipment for that or have to pay at least
some fees. A company can afford that, a private person can't. In the
past customers in the US have ordered HDDRIVER either from Atari
Workshop or directly from me, simply by sending me cash by certified
mail. This is secure and works.

> take into my consideration to not let a few bad apples in a group of loyal
> supporters (or at least WANT to be loyal supporters but just can't afford
> it and resort to AHDI) spoil your general demeanor.

The problem is that the number of bad apples is constantly growing ...

So, this mean that if I want to try any xxxxMiNT package I've to reinstall all the O.S., and lose the TOS/MultiTOS, right? (It will be a problem, 'cause I've bought my Falcon on eBay and I've all the software installed on HD, but no Disks, so if I've to reinstall will be a problem).
And, Free/Easy/SpareMiNT how much is compatible, if is, with the old programs?

Thank you, and excuse me but I'm a newbie with all other Atari compatible O.S. but TOS/MultiTOS :-)

This my be possible if you use XCONTROL, there is a program I think it's called Make CPX that will convert some programs (mostly Gem) into CPX modules it even converted a program I wrote using STOS into a working CPX module.

I keep getting a few of these older postings from my ISP in a sort of
"Twilight Zone" fashion ;-)

But I've got Samba working now. Seems I hadn't fully understood the config
files and had neglected to include the Falcon's IP address in the hosts file
and left out the workgroup name in the Samba config file :-(

Now it works very well, and when Vassilis adds Samba compatibility to BNet the
whole thing will become very well integrated with GEM :-)

I still can't get the patched version of aFTP or Amail to work however.

Cheers

I had a problem with an email with a file attachment. I knew that it was a
"pukka" file as it was one that I'd emailed to my home account from work.

The answer was to telnet to the POP3 server and delete the mail from there.

Cheers

> it easier to pay abroad - unless you can travel to the country.

This is why Uwe suggests to send cash: it's not that risky even if not
legal (at least from France). But international money transfers should
become free from next june or july 1st, or at least no more expensive
than national ones.

Bye,
/Pascal/

Source record: 35957

From: Mark Duckworth <mduckworth@antii-spam.atari-source.com>
Date: Sun, 7 Apr 2002 17:38:53 -0400

Mark,

>If I ever used commercial software illegally, it tended to be to evaluate
>the software for a reasonable period of time. I mean most people would
>actually want to use something for a month or two to see if they will run
>into strange problems before spending $100+ USD on it.

Bullshit....
Ever heard of demo versions?
These are made for only one purpose, and that's to give a potential user
the chance to evaluate the program before he eventually decides to buy it
or drop it.

>But when software authors almost seemingly purposefully make
>their software difficult to register, have pages and software in other
>languages and everything else, provide no support and aren't active in the
>atari community, why should you have to pay for it?

Some more bullshit....
I live in Belgium, to the best of my knowledge there are no Flemish Atari
programs available, following your logic, I don't have to pay for anything
anymore, simply because the programmers disregard and refuse to support my
native language? Now, *that's a thought....
Let's face it, if one doesn't have the incentive to pay for software he's
not going to go through any length of trouble and will make up all kind of
cheap excuses. So, do you really think you're the only US resident using
software written in a other language that needs to be registered at the
other side of the world? Assuming that everyone knows English is typical
for narrow minded Americans, if a programmer knows English well enough then
I'm convinced he'll produce an English version of his work, on condition
ofcourse that there's any interest for such a project.

>If you're going to sell something, support it. Offer a free copy to
>people willing to translate it. Offer a free copy to beta testers.

That's been happening for many years...
BTW: has it ever occured to you that there are people out there who
translate or betatest programs expecting nothing for it? You don't like
paying for software but the very instant you would have to invest time and
a little effort you expect something in return? A programmer shouldn't ask
money for his work, but you translating or betatesting his work should?
where I come from this is called "twisted logic" at it's very best :-/

>There's no reason people should pay for an abandoned dead end project like
>CAB. It should be released to the community and the author should chalk it
>off as a loss or a good deed. Not as if they would get any more money for
>it anyway.

I'm not aware of any official statements from ASH annoucing that CAB is a
dead end project, are you? CAB is still for sale, the latest English 2.8
version isn't even a year old...
Your reasoning sucks, why should the author do anything for us? we haven't
really done much for him in the first place. There are still people here
using the CAB demo with the STiK/STiNG stack. Instead of supporting the
author and his work, all he got in return were buckets full of shit, this
attitude is common here, at regular intervals which come like programmed
clockwork Uwe Seimet is confronted here with the same crap. You don't have
to like a person to buy or use his work. For many years now, anyone here
who has ever had a hard disk related problem, just had to yell, and by
magic out of the woordwork Dr. Seimet came along, offering help to anyone
disregarding if the person is a customer or not. What we've got here is an
author who supports his program *and* the Atari community, keep on bashing
him this way and maybe he'll finally throw the towel... once he's gone we
can add him to ever growing list of authors who abandoned their work and
this platform. Remember Peter Rottengatter (STiNG)? He received a similar
treatment here...

>CAB sucks anyway, highwire will be cool.

Ofcourse it's cool, all vapourware is cool....
I suggest to hold that particular discussion once that Highwire is capable
of everything which CAB can do right now, until then CAB is and remains the
only workable solution on this platform.
BTW: Please explain why CAB sucks.... AFAIK the program does everything
which is promised in the manual.

>GNU software is obviously what the Atari community needs. Look at what it
>has done for the PC world.

I'm looking and I don't see a lot... so what exactly has it done for the PC
World? It might be obvious to you, but it's certainly not obvious to me.
And please, please, please, explain what that GNU sofware can, will or
could do for this platform...

>Look at what it is doing for atari projects like QED, and Octopus. If a
>project is maintained, sure, closed source and costs money.

Just like with Highwire, let's discuss QED once its here. Until then there
are some nice alternatives around like for example Luna, which is available
and still under development, that beats any paper project in my book...

>I don't even know where I'm driving with this, but I want to pay for my
>software, but sometimes it's damn impossible or rediculously expensive.
>What is Calamus like near $1000? Alright fine, I simply won't use it.

Calamus SL2002 Light costs less then $50, don't be fooled by the "Light"
tag, unless you're trying to perform some specialised stuff there isn't a

lot that this version and the included modules can't do.

>For each pay product out there, chances are there's a free product that's
>as good or better.

Really? where are these wonderfull programs that are just as good as
Papyrus, Calamus, CAB, Photoline, Texel, Phoenix database, Coma, Aniplayer,
PhotoTip, Jinnee, Thing, Papillon, Porthos, Tempus Word Pro, N.AES, NVDI,
Cubase, Notator, CD Recorder Pro, CD Writer Suite, ExtenDOS, Artworx,
Arthur, Luna, Egale, ASH Scripter, GFA Basic, RSM, Papillon *AND* last but
not least HDDriver... to name just a few.
Name me just *one* single application that is just as good or even better
and costs nothing, if you can, I promise to put a sock in my big trap for
the rest of the month.

>I would suggest others do the same thing.

I suggest brain surgery...

Cheers from Belgium
Dennis

I once wanted to buy a scandoubler for the ST but IIRC the guy at the
company which sold them told me that he thinks it wouldn't work with
an Atari. Therefore I didn't buy it. So if anybody who really tried
to use one could tell about his experience I would be very interested.

I and quite some others receive daily 5 and more of such spam mails.
They all seems to come from Corea, hence the strange characters one get.
Personally I use Popwatch to retrieve all my mails. I don't retrieve the
spam mails however. I usualy reject then of just kill then. So far I
never have had any probs with these mails. Popwatch displays then nicely
in the window. If I want to I can even download then without any hassle.

I agree.
I have been using PayPal for some time now and it is VERY fast and easy to use. I have bought lots of stuff from eBay and paying by PayPal oftens gets your item shipped the next day. I have also sold items on eBay and then I ship the item the next day. It really does speed up the process and I've never had a problem with it. It's saved me loads of time waiting forever for stuff to show up. ;-)

Neither have I upto this particular one. Maybe it would have worked if I
skipped the GEM part and simply runned it in batch mode? I did not really
have the time to test it, but as Popwatch did crasch while building up
the mailbox list it may have worked with that step skipped.

This was anyway a warning that Popwatch can choke completely and make
your mails impossible to retrieve. It was not until I had deleted the
offending mail with Pine that I could get the others with Popwatch.

Good news is that when I tried to import the dodgy(?) mail into Okami it
worked perfectly, first decode from BASE64 and then displayed as html in
CAB. I did not let CAB downliad the images for obvious reasons, though.

Hi Stefan and Paul

As you might know, I am very interested in the story about Cubase
Lite, which you state is freeware. This is exiting news!!! Is this
official from Stienberg?
Does Atari actually mean something to Stienberg now??

As Paul has put it on his site, It probably is true, but would like
some feedback, as I would like to put the program on my own Cubase
page.

http:://tamw.atari-users.net/cubase.htm

Thanks for any feedback.

Tim

Don't want to mess up your sale, but M is freeware now with all the
docs, however, if you want the original disc and documentation, then I
suggest buying it.(as above). The manual is quite nice and it has a
pull out we could not put into the download docs.

To find out more about M, visit my M page:

> World? It might be obvious to you, but it's certainly not obvious to me.
> And please, please, please, explain what that GNU sofware can, will or
> could do for this platform...

I mostly agree with you, gut not at this point.
GNU project showed that it is possible to create and mantain complex
software projects by people for people. GNU did alot to the PC platform -
just look on last Microsoft movements againsg GNU/Linux community trying to
explain wht M$ products are better then GNU/Linux.

But we are missing the point. What GNU can do for Atari platform? (Dont ask
what GNU can do for you, ask what YOU can do for GNU ;))
Very simple: there is plenty of Unix compatibile GNU tools and programs that
we can use. The only effort we need, is porting this software to our
platform. We alread have an opensource operating system (FreeMiNT) that is
much better with every new release. The other part is standard library, we
have it to - MiNTLibs - it offers most of libc functions and makes porting
of GNU software fairly easy.

The problem is that all this will not do by itself, skilled people need to
do this.

At the end I would like to add that, by porting GNU software to our platform
you in fact improve it, making it better. So your work is worth not only for
us, but also for GNU community.

The last fact: by counting the effort put into GNU software, it was
estimated that it is work at least 1 billion dollars. And it is avialible
for free. Enjoy it.

I was doing it that way only I had a hard drive. It can be done with
floppies to a point. Do you have only 1 disk drive. It would be best to
have 2 otherwise there would be no room for storage.

I think so. But ISTR that Timeworks used a strange implementation of the scrollbar, which GST justified by saying that the Atari version of GEM was different to the original PC version of GEM from which it was derived. I think they said that pressing the down-arrow button should scroll a page, rather than just a line.

The end result was that the a single click responded like two seperate clicks.

> I rechecked, and it seems that by pressing the gray parts around the

The arow scrolls by one line, while the grey section scrolls a page. This is normal on all TOS versions, isn't it? (Or is my memory going...)

3229. Mega STe Woes :'(

Newsgroup: comp.sys.atari.st
Date: 2002-04-11 00:08:44 UTC
From: Mark Duckworth <mduckworth@antii-spam.atari-source.com>
Message-ID: <1018483766.240427@pikachu>
Source record: 35980

Hey guys,

I little while ago, I decided my Mega STe was mounted improperly in it's case and that there was too much chance something would short. Ironically my recasing of it is what killed it. The case I was using was an old sun photoprocessor with a PC power supply. Before I actually rewired an AT power supply but this time I bought a new one and I figured out that the Mega STe uses the same pinout as AT power supply. Is this notion correct? Making sure that the ground leads are int he center?

At any rate when I was rebuilding it the first time, I made sure I had everything right, and I had a small wirewrap wire lead hanging off the reset pins. The machine was completely off but I left it plugged in. Throughout the machine there is a couple very tiny exposed spots that have 120VAC. I saw a large flash and apparently 120VAC hit SOMEWHERE on my board. But... there's no char marks that would ordinarily result. Even those wirewrap wires were perfectly untouched leading me to believe 120VAC shorted from the reset lead to the ground of the case.

Nonetheless the Mega STe won't boot. I get a black screen, and no evidence of it working. No floppy access. Nothing. The 68000 gets rather hot (seems abnormal to me) and that's it. Could I POSSIBLY be powering it up wrong with the AT power supply? Could anyone help me diagnose it? I need to find my logic probe and get to work and see if anything is happening or if it's just fried. With luck, one of the socketed chips are fried and I can just simply replace it.

Thanks for any help.. I miss my STe :'(

You could buy a straight-through 25-pin cable like the type used for
switchboxes, then nip off the shielding and pins you don't need.

It won't be pretty, but it should work as long as the cable is fairly
short.

Just a suggestion...

I think there are a couple of small programs that allow you to do
this. STARTGEM was one and I think HEADSTRT was another. They are very
small utilities.

It's also possible to use a bootselector like Superboot to launch a
GEM program at start-up - and I think STARTGEM is included in this
archive for users who have a low TOS version.

Hope that helps

>

One reason why I think the Lite version was released as freeware is because it was not copy-protected. So all the author has to do is zip it up and set it free. Since the full version of Cubase (and all Emagic stuff) is copy-protected, I think there will have to be a good amount of hacking / reprograming involved to remove the copy protection. :(

Thanks for this. I have emailed him. he has an interesting site as
well. I thought that this version does not work on 030 machines, but
works fine on my TT (ST HI res) Its a "bare-bones" Cubase version but
very workable. The only editor is a score module, which is OK, none of
the other editors are there. However you can compose using the
"famous" Arrangemnt screen.

This is great news!!

Tim

No cables, but I have a limited supply of connectors and hoods, for about $6.00
a set plus any tax and shipping.
Just keep the cable short, 18 inches.

And I'm getting the few hundred other ST goodies reinventoried.

But the problem is that if you send me such a cheque I will have to pay
a fee for cashing it and this fee is usually higher than the actual
update fee. With Eurocheques there were no such fees, but this has
changed in 2002 unfortunately.

>Has anyone tried connecting to the internet via an emulated Atari ST?
>Just wondering if it would work...

Yes, I have done this in the past using Gemulator and STinG. It did work
but I had to use an older STinG version because of a problem With
Gemulator and interrupts. I could not use HSMODEM but Fastserial(name?)
worked fine.

With this setup running under Geneva+Nedodesk I could run CAB and any
other STinG client on the pc and connect to my Ataris through the serial
port. Also possible to have tcp/ip between the emulated Atari and Windows
on the same physical computer as it uses Ethernet and one of my Ataris
has an Ethernet adaptor.

Since then new verions of Gemulator are out so perhaps it will work with
the latest STinG now. I have not tested.

Anyway this was quite practical as I could use BNET to share drives
between the real and emulated Atari without using floppies. I even had an
automated e-mail posting script for Okami (on the real Atari) that
fetched a textfile from LDW Power on Gemulator once a week to my work.

I don't quite understand what you're looking for. Get started with
easymint - the easymint packages are a well chosen selection of sparemint
rpm packages that you need - and after that use rpm to add rpm packages,
update rpm packages, remove rpm packages, test, check, etcetera. What more
do you need ? If Easymint, including Redhat Packages Manager (rpm) is not
a SpareMiNT installer, what is ?

Yes, simply in used keytb105 and modify it, to get a new
program which map the PS/2 keys on Atari keys. That'all,
it work very fine and i use it since few week now...But
i have only a map file for french keyboard.

But it seems that some people are able to use oxo driver under
magic, perhaps i'm too bad to configure Magic with adaptakey driver !

I hope so :-)
I guess it's a fiscal law issue or the like. I'll try to find the real
reason.

I sometimes use this way of payment, and did it to send money to USA,
Germany, UK iirc. Never had a problem. I take care to make the note(s)
not visible in the envelope, with two postcards for example.

Bye,
/Pascal/

It's a tiny amount, around 20 bytes per folder, if I recall correctly. With
TOS 1.4 and newer, you can pretty much use 200 and hardly ever hit the limit.
That's because these OSes free up entries in the pool more reliably than 1.0
and 1.2.

Note that some hard disk drivers have this option built-into them, so you may
not need to use the separate AUTO folder program.

Yeah, I'm currently looking at it.
I've already compiled it successfully *under Linux x86*, tried to play
a bit, works nice!

For the Atari port I have just finished downloading all the necessary
libs (and the C++ cross-compiler I thought I wouldn't need...): will
try compiling late this night if I have some time...

I will keep you informed (on this newsgroup).

No, it is not a error in the mouse driver. It is the AES that is wrong.
It gets a single click from the mouse driver but sends a ill
conceived second WM_ARROWED message.
It does so only in the case of clicking in the scroll area or on a arrow.

Only certain Atari AES's have the problem. ;-)

'content with'?

In what way is the NOVA card better than the Eclipse?
The former is an ISA bridge that supposedly only works with the graphics
cards it was sold with. The latter is a PCI bridge that should work
with any normal PCI card (the lack of bus mastering capabilities is
a problem, though).

'crappy driver'?

I assume you are talking about fVDI/Eclipse/RageII? In what way is
that crappy?
It is a lot faster than the NOVA drivers (or indeed any graphics
card drivers for Atari compatible machines according to the benchmarks
I've seen) and has more features (it does still lack a few too, though).
Apart from a couple of mostly minor problems, it is compatible with
just about all Atari software out there. And since it is still actively
supported, most reported bugs/problems are usually fixed quickly.

>> From: rustynutt@hotmail.com (rustynutt)
...
>addition, the Tempest card requires fVDI, which is not nearly as
>popular as NVDI. I'd love a graphics card, but I'm not willing to

Well, the lack of popularity of fVDI might have something to do with
the fact that unless you have an Eclipse/RageII or a Galaxy graphics
card, or are running ARAnyM, there currently really is no point in
using fVDI.
(The old monochrome driver is just about usable too, but there is no
4 or 256 colour bitplane support at all, the 16 colour driver lacks
colour for some things, and the 16 bit driver is really only intended
as an example (its almost 100% relatively unoptimized C code).)

That cuts the current user base down to one hundred people or less,
I think, which might indeed count as 'not popular'. ;-)

Anyway, that's beside the point, since NVDI works perfectly together
with fVDI (AFAIK), so you can have all your vector fonts, printer
drivers etc while running in 1600x1200x16bit@75Hz or whatever.
You lose some speed compared to running fVDI by itself, but it should
still be faster than anything else out there.

>make my machine unstable to get a higher resolution.

Higher resolutions in themselves are perhaps not all that much of
an absolute 'must have' feature, but the speed certainly is for me.
Just imagine almost everything (not including colour image blits)
being as fast as (or faster than) monochrome mode, no matter what
bit depth and resolution you use...

I've not heard of fVDI/Eclipse causing any instability.

I can't recall hearing from anyone who isn't happy with his
Eclipse/RageII (not counting the few who had some kind of hardware
problems (with their Falcons, their installation or their Eclipse
boards) that made it not work at all).

(Just so that there is no misunderstanding:
I don't make any money whatsoever from sells of Eclipse/RageII cards.
I genuinely like the card and would never use my AB040 Falcon without
it. I do know the developer of the Eclipse and Tempest personally,
but that does not stop me from ordering a CT60 and registering as a

developer for that, nor from working on getting the fVDI/RageII driver
to work on the Milan and Hades.)

I had no idea fVDI could be used just for hardware control, allowing
NVDI to deal with fonts and drivers. How is this accomplished?

The same way NVDI works together with any other VDI, NOVA or otherwise.

Simply remove/rename the screen driver NVDI would normally have used
and it will use whatever VDI is already there instead. If fVDI was
before NVDI in the AUTO folder, NVDI will use fVDI as a kind of
device driver (NVDI will build monochrome bitmaps of text in RAM,
for example, and use fVDI's vrt_cpyfm to blit them to the screen).

This works even with the built in VDI, by the way.

Source record: 35940

From: Frederic Fouche <g213778@coazter.myip.org>
Date: Mon, 8 Apr 2002 19:36:27 -0500

Hi Frederic,

>>It should be released to the community and the author should chalk it off as
>>a loss or a good deed. Not as if they would get any more money for it
>>anyway. CAB sucks anyway, highwire will be cool.
>
>I agree with you. When you can not support a software, just offer a free
>version, that's the way most companies do.

I'm not surprised one little bit that you agree with that turkey, but I would
really like to find out what companies offer these free versions, you did say
"most" companies didn't you? We are talking about the Atari platform I hope?

And to stop this silly nonsense about a free CAB may I point out to you and the
other members of the fanclub that there is a free version of CAB available....
CAB 1.5, as a matter of fact all the software written by Alexander Claus is
freeware. IMO CD Player and OCR are among the best programs in their category
available on this platform. Before you try to be the wiseguy and tell me that
the CAB version of ASH isn't free, I know, but from CAB 2.0 onwards the program
was developed by a team of programmers, not exclusively by Alexander Claus.

>This applies in my opinion to CAB and the likes.

Offering unsupported software for free might seem to be attractive but in the
long end will kill off the very little that remains.
For example: remember when Interface the RSC construction kit became freeware?
Just a couple of weeks later Armin Diedering announced that RSM wouldn't be
developed any further... programs like these are bought only by a very small
group of people, and although RSM has more features, Interface is good enough
for most of us, the free but outdated Interface harmed all possible further
sales of RSM.
The result is that we now have a free unsupported showing it's age version of
Interface and are stuck with a very promising but no more further developed
version of RSM... just tell me who's the winner here? it's certainly not the
Atari user and or Atari community.
So, who here has the guts to ask Armin Diedering to release RSM as freeware?

>As far as HDDRIVER, Uwe still works on it, he provides help on newsgroups,
>works with other developers (hard/software), direct contact with users etc
>etc.
>This is a still very active project, Uwe deserves the money.

Indeed, and for people having a bad memory it's also worth mentioning that
Uwe released OUTSIDE as freeware. He didn't have to, but he did it anyway. He

doesn't only deserve the money for his work but more important he deserves our respect. For almost a year now there's an ongoing campaign in CSAST questioning not only his motives as a programmer but also questioning and attacking his individual choices and opinions. Some people seem to think that a programmer should only program and doesn't have the right to air his opinion and personal views, these morons probably never heard of the right of free speech. I for one am very glad that Uwe stood up against them, and didn't walk away.

>The software is already written, if the author feels not enought money
>was made while it was still a "hot" product. That certainly is not gonna
>happen years after the "death" of the project.

I don't understand this obsession about people wanting old stuff released for free, where's the benefit? The general opinion here is that CAB sucks, yet everyone wants it to become freeware.... why? I'm also asking myself what program these people use right now to surf... it can't be CAB, otherwise they wouldn't ask for it, and demand is dead for it anyway I'm told...

Cheers from Belgium
Dennis

From: Adam Klobukowski <atari@gabo.pl>
Date: Wed, 10 Apr 2002 20:30:53 +0000 (UTC)

Hi Adam,

>But we are missing the point. What GNU can do for Atari platform? (Dont ask
>what GNU can do for you, ask what YOU can do for GNU ;))
>Very simple: there is plenty of Unix compatibile GNU tools and programs that
>we can use. The only effort we need, is porting this software to our
>platform. We alread have an opensource operating system (FreeMiNT) that is
>much better with every new release. The other part is standard library, we
>have it to - MiNTLibs - it offers most of libc functions and makes porting
>of GNU software fairly easy.

Thanks for the informative post, if this reply pisses you off... sorry,
it's not really my intention, but in my experience some of the people here
only like to read and hear what they believe in, controversial opinions are
instantly labeled as being negative and killing off what ever is left of
this platform... well, I'm gonna put my foot in it anyway :-/
You see Adam, the problem is that all of the above isn't hot news. I've
been hearing it now for well over six years, so does it surprise you that
after all this time I'm still asking what it can do for us? I've been told
here by numerous people in the past to just sit back, relax and watch all
that stuff appearing....
I did ask what GNU could do for the Atari platform right? I didn't ask what
it could do for MiNT & MiNTNET users... it's no secret in this group that
I'm not exactly a fan of MiNT, I am aware that FreeMiNT gets better with
every new release and I'm also aware of the tons of ported software which
is available right now for MiNT and MinTNet. The problem however is that
almost all that software is either geared towards MiNTNet or are MiNT OS
related apps. I am not thrilled reading about for example that yet another
FTP server is being ported over, although I realise that it may be essential
for some.

What I'm waiting for really are some more "down to earth" apps like for
example a relational database. The only decent (unsupported) database
available right now is the ASH Phoenix database, which is only available in
German, since it's a rather complicated program most people can't use it. A
spreadsheet with more or less the same features as Texel would be very
welcome as well, as long as it can read/write the MS Exell crap... Most of
us have a printer and a scanner, a nice app that turns this combination into
a photocopier would be god sent. Or what about a realtime dictionary ? Hell,
there are at least thousand and one applications out there that we're
missing out on. Do you realise that there's not even a decent OCR
application available for this platform? I'm very aware of the limitations

set by the Atari hardware, so unlike some people I'm not asking for a ported Mozilla or Office Suite, just some relatively simple software which should IMO run at an acceptable speed on minimum a 68030.

I'm gonna walk on eggshells now Adam and try not to start a OS war...

Has anyone ever wandered why MagiC became so popular on this platform? It wasn't the OS which made it so popular, MiNT is probably just as good. It's the apps that turned MagiC into an instant hit. No matter how good the OS is, when the software isn't there or isn't up to standard most users won't even look at it. It's a pity really we can't ask the hundred thousands of former Atari users why exactly they left this platform. But without any doubt it will mostly be a software related problem. As far as I can tell the ported software has two shortcomings, there's hardly anything out there that can be labeled as "general productivity" software, which believe it or not is the most used , even on this platform. The second shortcoming is far more serious: all that ported software has one thing in common: it disregards nearly all the available protocols that turns "Atari computing" into a great experience and fun to use. One of the reasons I still like this platform and it's software is because there are such things like OLGA, DHST, Drag & Drop, GEMBubble help, GEMScript, ARGV, STGUIDE, WDialog, the AV protocols etc... most of these established standards are not supported by the ported apps. The developers seem to think that as long as there is a very basic GEM front end in place, the users will be happy, did I mention those damned TTP based applications which warp us right back in the stone age?

MagiC and MiNT both know FAT32, and HDDriver is able to partition this type of partition format. So what about a nice 40GB harddisk with two large FAT32 20GB partitions? no problem.... well, actually there is a problem. There's no software available to optimize or repair FAT32 partitions. A while ago someone told me different and directed me to a ported MiNT program which could do all this. The only problem is that it's a TTP.... I'm a brave man, but I'm not crazy. Risking my data if I make a typo in the command line? NO WAY!!! Is it really so difficult to write a simple GEM shell? If someone goes through the trouble of porting software why is it so difficult to make it a bit more user friendly?

So, as long as these ported apps remain focused on network related stuff, neglect the established Atari standards and remain user-unfriendly I'm afraid that I'm not going to join the "happy GNU users club".
I can't imagine that I'm the only one here who thinks like this, I'm just your average Atari user, like me there are thirthteen in a dozen....

>The problem is that all this will not do by itself, skilled people need to
>do this.

Ah... well then I'm afraid it will never happen, if these these skilled people are still here then they must be hiding under a rock somewhere, they are all afraid to come out... buckets full of shit have been poured over their heads here in the past.

Cheers from Belgium
Dennis

Yes, that's the way it is. I am not charged anything for cashing a
cheque, as long as this cheque is drawn on a German bank. In any other
case fees have to be paid. The banks charge this fee (as they say)
because it costs them money to transfer money from your account to mine,
just like they charge money for regular bank transfers between European
countries.

Hi Nagual (?),

> If anyone know how to create query in Phoenix database hrom ASH to select
> all items between two values?

It seems to be not too difficult:

```
select your_field from your_table where (your_field > 1) and (your_field
< 100)
```

Perhaps this way? please search deeply in the online-help-system for SQL-Operators and have a look at all sample queries. There could be mistakes in using brackets and writing in capitals or not. The interpreter is not really friendly.

regards, Ludwig

>
> I will keep you informed (on this newsgroup).

Compiled it last night, with quite a few warnings and a problem:
current Atari SDL (last binary on Patrice Mandin's site) currently
lacks audio support (2 functions are reported to lack through the
compilation).

However I commented out the two references to them and it compiled
fine (the stripped executable is about 500k in case you wondered). Oh
BTW I am talking about the 0.1.0 version, I have not tried compiling
some recent CVS snapshot yet...

I only had the time to test it under XSteem, where it failed miserably
:-(I did not even get the command line prompt, but remember that
AFAIK Steem system emulation is poor... And I only tried quickly it
with TOS 1.06 with only 1 MB RAM so I did not expect much from the
try. Time to fire up my Falcon again or install a decent ARanyM setup!
:-)

Greetings,

Just thought that all of you might like to know that there is a complete Hybrid Arts Adap II system for sale on eBay. This is a professional rack mount 16-but, 44khz sampler and hard disk recording system which runs from and includes a rack mounted Mega ST, Rack mount hard disks, Monitor, etc... Back before this sort of capability was common in computers (like the Falcon) the Adap II was used for Hollywood films and TV shows (Born on the Fourth of July, War of the Worlds TV series, etc...)

Get yours now! ;)

Hybrid Arts ADAP II System

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=2015185222

Dear Atari users

A new revision of the EtherNE package is available on my web site:

http://home.nexgo.de/thomas.redelberger/prj/atari/download/etherne.zip

New:

- Amendments and clarifications to the EtherNEC hardware schematics (all 74xx245 now)

- Added hardware test programs with documentation

- Debug printouts in drivers suppressed

- Added code to deal with some broken NE cards

Best regards
Thomas

Hi All

Just updated my Cubase page since learning from this newsgrp that Stienberg had decided to release the Atari version of Cubase Lite back to the Atari Community. Thanks to Paul and Oliver for this info.

Go here for info, a screenshot, and of course the download:

http://tamw.atari-users.net/cubase.htm

I think this is great news that Stienberg has decided to do this and remebering it's Atari roots!

Yes, indeed. But note that they say that even though PayPal doesn't
charge anything when money is transferred from PayPal to a bank account,
the bank may take a fee ;-). There is nothing like a free lunch ...

>directly into the system you were running GEMulator on? I have a home

No, when using a standard modem I had it connected to an Atari TT and
used STinG's built in NAT (Network Address Translation, IP masquerades).
Worked fine.

Later on (with Ethernet on one of my Ataris) I used the same TT as router
to a nullmodem subnet to the COM2 of the pc which Gemulator were setup to
use. Also worked fine and for the first time I had a "non-floppy network"
to the Windows part of the same computer.

>network and my PC only has a NIC. Wonder if there is a way to get it to
>work with this setup...

A rather tricky way would be to use a nullmodem cable connected to COM1
and COM2 on your pc to allow a direct network Windows to Gemulator. You
will then need to setup a NAT solution in Windows that supports serial
cable SLIP or ppp without dialing out first. I know it can be done but
have never tried exactly this.

To get genuine Gemulator tcp/ip access both the Gemulator and STinG
athors would have to work something out together. Maybe possible as they
both are Assembler guys?

I don't think CAB sucks. It's still the best browser for Atari. Yes,
Highwire is promising, but they still have a long way to go just to reach
CAB's level. And after that much things have to be added to go beyond that
level.

My problem is that I'm willing to pay for CAB, but no one wants to sell it
to me. If software is not free, at least you should be able to buy it
without much problems.

>with fVDI (AFAIK), so you can have all your vector fonts, printer
>drivers etc while running in 1600x1200x16bit@75Hz or whatever.

Does this mean that if I put a Galaxy graphics card in my TT and run
NVDI5 on top of fVDI I will get exactly the same compatibility as now
with NVDI5 and an ET4000 card?

>You lose some speed compared to running fVDI by itself, but it should
>still be faster than anything else out there.

It will definitely be much faster than any ET4000 I suppose?

If the abowe is true then there is really no reason not to order the
Galaxy graphics card right away I assume...

If he gets a few buyers (many TT owners would be interested, I guess) he
might take the time and finish the Ethernet part as well and get a killer
product...

> (it does still lack a few too, though).
>Apart from a couple of mostly minor problems, it is compatible with
>just about all Atari software out there. And since it is still actively
>supported, most reported bugs/problems are usually fixed quickly.

What you call minor problems may be very annoying and perceived by the
user as major problems. But I shouldn't have written "crappy", I should
have written " a card and driver which is not supported by most of the
major Atari software".
In a perfect world the installation of a graphic card should be just a
matter of installing the driver and never have to look back. And that's
exactly what happens if someone installs a Nova card. The Nova card is
supported by almost all the popular software and thus the user doesn't
experience any "minor" problems at all...

I know that the Nova drivers weren't perfect from day one, but now they
are... new drivers should be at least just as good, and that's where the
problem begins. Most of our software hasn't seen an update in minimum two
or three years, the Eclipse/Rage II card isn't really supported by this
software. A Jinnee user might be content when dragging icons over the
screen with seeing just garbage, I know I wouldn't.

>It is a lot faster than the NOVA drivers (or indeed any graphics
>card drivers for Atari compatible machines according to the benchmarks
>I've seen) and has more features

Ofcourse it's faster, the fastest Nova card only contains a MACH64 based
card with 4Mb VRAM.
As for features.... how does one switch the Eclipse card to ST High
compatible resolution? How and with what does one configure the card in
order to be able using custom resolutions and color depth? Where's the CPX
that allows the user to for example switch resolutions instantly, have a
mouse speeder, select a virtual resolution, calibrate the image on the
screen etc... Does the Eclipse card support 16 colours? does it support
320*200 ? How and with what can the user toggle GDOS off/on? etc....

Cheers from Belgium
Dennis

>worked fine.

With MagiC-PC and MagiC-Mac one can do the same thing using the IConnect stack. On a Mac one can even use the Apple stack. HS Modem works just fine, MagiC-Mac however needs a special version of HSModem which comes supplied with the program. And before someone bites my nose off: Ifusion works as well so using STiNG clients is also an option ;-)

On a fast PC or Mac accessing internet via the Atari clients is a very good way to keep nasty virusses out, and it also shows that CAB doesn't suck at all. Under certain conditions it's faster then Netscape, Explorer and Opera, as long as the page doesn't contain anything exotic CAB is likely to display it better as well.

Cheers from Belgium
Dennis

Hi Harry,

>Nothing appears with Ctrl-Alt-Esc, but they do all appear under
>Magicmem...

SLB's aren't applications which you can switch on or off, so they are
not shown in the tasklist.

As for APP-line displaying them or not, check out the inf file. Most
likely they are entered in the line: "# The following applications
will not have buttons added to the AppLine bar:"
i.e: PDLG, EDITOBJC, BGH etc... if they are in that section, throw
them out and the next time you boot, the SLB's will be displayed in
the APP-Line bar.
But since the user is not supposed to freeze or terminate SLB's,
other then knowing that they're actually loaded in memory, displaying
them in APP-Line isn't really meaningfull.

One of the best applications to find out what exactly is running and
where and how much memory is occupied is SYSINFO 5.0, freeware, you
can download it from the Chapelie ftp server... there's an English
version available as well.

Cheers from Belgium
Dennis

Well dont get me wrong, but u arent "not a fan" but u lean toward hating MiNT.. Noone of those apps is geared toward MiNTNET or MiNTOS.. Those apps are Unix apps and require Unix like OS and IP stack... Some of your fav apps indicate VERY clearly that they need Magic to run... Pine on other hand will run in Linux, Solaris, MiNT and any other Unix OS..

Small comparision: Apps like Atari irc, Atari icq, Aftp, Amail are regarded as MiNT OS apps, but they do work in Magic as well.. On other hand apps like Chatter, Mailer, Iconnect are infact gained toward MagicOS. Ported apps arent exactly MiNT OS or Atari apps, they are a bonus, a stuff u also can do, and they shouldnt really count.

So there is no "pushing" toward MiNT OS, but simple necesity, since those apps are ported from Unix.. MiNT on other hand offers a way to run many of those apps (sadly mostly the ones which dont rely hardly on Unix filesystem structure etc...) as .TOS(TTP) apps in TOS or Magic, since any GCC compiled app is actualy a .TTP.

Next, there are not just zillion of ftp servers ported, but also drivers and processing software for a lot of digital cams (Sanyo firmvare, Sierra firmware...), PDF interpreter and renderer, to name a few apps which are discussed here a lot.. realtime dictionary also exists (ispell) but again it wont work with GEM apps. But that is because GEM limitations...

> I'm gonna walk on eggshells now Adam and try not to start a OS war...

OS wars starts when u guys, start to calling names, and use a lot of "F" words and so on.. And also, MiNt is as we speak heavily developed, changes apear almost daily, lotsa new stuff is worked on, a lot on "to do" list, new AES is also under heavy development... Work on Magic is on ice... Fans like MagicNET auther etc does indeed push things forward, and is only to ba happy about, but basicaly atm, Magic seems to be in dead end...

> Has anyone ever wandered why MagiC became so popular on this platform? It
> wasn't the OS which made it so popular, MiNT is probably just as good. It's

> even look at it. It's a pity really we can't ask the hundred thousands of
> former Atari users why exactly they left this platform. But without any
> doubt it will mostly be a software related problem.

I can agree more with this definition... BUT MiNT is not only ported
apps, or apps noone understand.. Remember, that main usage of MiNT is with
AES after all (NAES or XaAES). And i even today cant see a reason why ASH
decided to make Chatter, Emailer... Magic only. Texel or Cab run
flawlessly, CAB even with SSL etc.. Other apps say "Magic required" and
exit.. and that aint MiNT OS fault. So MiNT OS basicaly run nearly all
apps Magic can, except "privileged" ones... Only apps which could be labeled
as MiNT only are Unix apps, drivers etc... And even those can cooperate
with GEM.. take NFS for example... MiNT OS is infact merging of Unix and
GEM AES. And Atari feeling dont loose anything.. only benefits.

> ported software has two shortcomings, there's hardly anything out there that

> applications which warp us right back in the stone age

All protocols u mentioned works without any problem in MiNT OS, with
exception of GEMScript. And feeling of "Atari computing" is very vell
preserved, more as in Magic which does have strong influence from Mac.

CLI is way from stoneage... Infact a lot of GUI OSes still dont have
many things CLI does have.. and they would benefit a lot.. CLI is very
diferent as GUI, and it does rely on typing commands, but that does not
make it obsolete and stoneaged.. What make it look shitty and odd is
actualy GUI's handling of TTP apps.. Small dialog with no explanations etc
is crapy...

> MagiC and MiNT both know FAT32, and HDDriver is able to partition this type
> of partition format. So what about a nice 40GB harddisk with two large FAT32
> 20GB partitions? no problem.... well, actually there is a problem. There's

> someone told me different and directed me to a ported MiNT program which
> could do all this. The only problem is that it's a TTP.... I'm a brave man,
> but I'm not crazy. Risking my data if I make a typo in the command line? NO
> WAY!!! Is it really so difficult to write a simple GEM shell? If someone
> goes through the trouble of porting software why is it so difficult to make
> it a bit more user friendly?

1st of all, a typo which erase all data is domain of Hollywood movies.
Next, i did use GEM and CLI based apps which mingled with HDD and for BOTH
i did read docs... GEM dont make u expert.. and its easier to click on
"zeroing partiton" as to type whole such word... Most of smart CLI apps
require to type dangerous commands. Magic realy would benefit with EXT2
driver.. Those partitions are sturdier as FAT partitons, faster, and u may
forget optimizing...

And yes, adding GEM shell is not easy... Porting app means to recompile
source (since Unix apps are usualy distributed in source form) on your OS.
Novadays MiNT OS has good library etc, so porting of an app usualy is
only matter of downloading it, depacking and typing "make ********"
Adding GEM shell means writing an application.. And for u, using a GEM
shell is to trust programmer he didnt make a typo when coding GEM shell.

Last but not least, someone bothered to port a tool ppl realy need.. Now
that tool dont have nifty icons and so ppl dont apreciate now.. Lets kill
the bastard, how he has the guts to offer a tool without GUI.. Better be
without it..

> So, as long as these ported apps remain focused on network related stuff,
> neglect the established Atari standards and remain user-unfriendly I'm
> afraid that I'm not going to join the "happy GNU users club".
> I can't imagine that I'm the only one here who thinks like this, I'm just
> your average Atari user, like me there are thirthteen in a dozen....

U do think to narrow here... ported apps do add functionality to GEM and
do not threat "Atari feeling" Of course not all of them. But if i can make
network related stuff remark, NFS is great stuff.. i love it, and i know u
would.. its transparent and u use your OS same as u did before.. u just
can have direct acces to HDD's in your lan, or even remote machines.. next
X server is also cool.. and again in MiNT fashion (try to preserve Atari
feeling) it allows to run X applications in GEM. A GEM window popup and
contain X application.. No need to run strange Xwindows GUI etc.. Data
exchange betwen GEM and X is kinda working, and planed to be better and
easier... I see no problem of running Knews instead Newsie in GEM. Or if
someone use linux server, running Netscape etc from remote machine? I
agree, its not an Atari app, but atleast u can still sit behind your
beloved machine, using beloved apps..

And how many OS-es can run native and foreign apps at same time in native
GUI? I dont know any..

> Ah... well then I'm afraid it will never happen, if these these skilled
> people are still here then they must be hiding under a rock somewhere, they
> are all afraid to come out... buckets full of shit have been poured over
> their heads here in the past.

Again, u seem convinced MiNT OS only use those ports... MiNT OS can use
exactly same application u use (xcept the ones which require Magic), use
same protocols (VA, DHCP, OLGA, DnD (u can drag stuff to Unix apps as
well), ARGV, Bubbles, STguide... work in AES does not differ at all.
Diference is posibility of using drivers and Unix capabilites in GEM (Lan,

ethernet cards (i use riebl), FS drivers, runing X application on GEM (local or remote) and so on, or even using Unix CLI and huge ammount of Unix apps parallel with GEM.. I dont see any harm or bad thing on that..

Buy without problems....

Have you tried Atari Workshop or my own web shop
http://www.1632-sales.zenwebhosting.com/acatalog/16_32_Catalogue_Atari_Utili
ty_Software_7.html

I also believe you can buy form ASH and get it from the European PD
place(whose name I have temporarily forgotten)... support people who
support Atari...Make an effort!!
For example with me you can pay by credit card, personal cheque in Euros,
Euro cash, even my own currency sterling!.. how much easier does it need to
be?

Otherwise I totally agree with you re Uwe (power to his code) and other who
support Atari mostly in their spare time.

Hi there,
I am looking for someone in the Stuttgart area with a 1040DT with a SCSI connection. My harddisk broke, and after putting a new controller in, we got it to work again. My Atari is in storage, so we can't test it. I urgently need some data from this disk. Tried connecting to a PC, but that don't work because of differences in filestructure. Can anybody help?
Regards, Wim Vleeshhouwer.

GEMXPLORE for your PC. You might also want to try Gemulator while
you're there.

Gem Explorer can see your Atari Formatted drive and grab files from it.
The catch is, you'll have to grab the files one at a time (unless there has
been an update recently). You can't simply drag a whole folder from
the explorer to copy all it's contents :/

Gemulator can also run off your Atari Formatted hard drive...
You'll need a tos image to get Gemulator running.

Try this url:
http://www.emulators.com/

If you need TOS roms try:
http://www.atari.st/

Good luck!
Brian

3310. TT030 Won't Boot

If it got that far in booting, my guess is the TOS roms are either dead,
or they need a little reseating. That general pattern is what you get when
a diagnostic cartridge is testing memory, and displaying it on the
screen. That is what makes me thing that TOS is broken, or redirecting the
screen memory to some other place. Start by observing static elimination
rules, and have a go at reseating those chips.

I am certain it can be done, but I just tried installing Sting
version 26, and ended up putting version 15 back in. Has anyone
gotten it to run with a .inf path anything like D:\STING\STING\?
Have not tried the simple way in the HYP file, because my
c-drive is full. There must be something simple I missed.

Jim

No problems. Just moved mine here and rebooted.

>Have not tried the simple way in the HYP file, because my
>c-drive is full. There must be something simple I missed.

Yes, you have forgotten to update some of the files, possibly any STinG
cpx or so. The serial port cpx does not need to be replaced, but you can
easy track the problem down by checking file dates.

You could try the other method that's mentioned, the STING.DAT file which
you pop into the root of C:

This text file points to the exact location of your config folder.

Cheers

Did you know it is possible to run STiNG without having to install
XControl or any of those CPX files ?
It was my favourite setup when I wasn't using MiNTnet yet. You'll need a
little autofolder called DEVSET.PRG which I found somewhere on the site of
Olivier Booklage (the french guy that made another cab.ovl). If you edit
the devset.inf file be careful not to put spaces where real tabs are
required. The program is little bit picky in that aspect.

Let see SpreMiNT Software Archive (sparemint.atari.org):

* mgetty-sendfax
Summary: Provides support for sending faxes over a modem.
* mgetty-voice
Summary: A program for using your modem and mgetty as an
answering machine
* camediaplay
Summary: Utility to control digital cameras based on
Sanyo firmware

* photopc
Summary: Utility to control digital cameras based on
Sierra Imaging firmware

.... and many many more... programming languages, relational databases...

Unfortunetly (for most users) they are Unix command-line tools. DOes it
scare you? It doesn't scare me... It does not have gui? Guis waste CPU.

You can say all this has been ported. Yes. What wrong with that? MiNT can
alaso run all cleanly written SingleTos software and Magic software. Is it
enough?

> I'm gonna walk on eggshells now Adam and try not to start a OS war...

OS war is not my intentio to. Our world is too small for another war.

MiNT offers all GEMDOS funcitions that Magic do (and even more). AES
functions depends on the AES you use).

Protocols. Yes. Protocols. The thing that make some people mad. Protocols
have one very big shortcoming. THey allow (or even force) one program to
look into memory of other program. This makes very hard to write any kind of
real Virtual Memory + Memory Protection OS. In most of modern uses all
programs are stricty restricted to their private memory.

Wdialog is a thing that makes ME (and not only me) very angry. Yes, it
offers some aditional functions, but it is a very dirty hack that makes MiNT
systems very unstable.

> MagiC and MiNT both know FAT32, and HDDriver is able to partition this type

> WAY!!! Is it really so difficult to write a simple GEM shell? If someone
> goes through the trouble of porting software why is it so difficult to make
> it a bit more user friendly?

So you cann't trust command line, but you can trust mouse? I see not
difference between making risky thinks with GUI and without. And why the
hell TTP programs are worse then GUI? Becouse they do not have GUI? I do not
want to insult anybody but this way of thinking is... unwise.

Here I would like to clarify "The GUI problem":
The truth is that most programs is written by GEEKS. It is even more visible
on small platforms like ours. And GEEKS, in general, do not care about GUI.
Yes, there are some people that even in GEEKS community are considered as
GEEKS, that care about GUIs, but they are outnumbered.
But even for GEEKS there becomes situation that they are interested in GUIs.
And they write GUIs. GUIs writeen by geeks are so flashy and so extremally

usefull, that only GEEKS are able to use it. ;-)

As a last word, I'll quote Zerkman, author of CD-LAB: "I hate writting GUIs"
:-)

I've always loved those typical Atari GEM programs with their userfriendly
GUIs. That's why I bought an Atari in the first place. But I have come
to appreciate the MiNT command-line tools more and more. In the middle of
all the icons on my THiNG desktop, I have now a completely mouse-free
zone: my bash shell running in a TosWin2 window. This is now my starting
point to the Internet. I can browse the net (lynx), mail and read news
(pine, mutt), ftp (ncftp), without having to open, move, and close
multiple windows, and without ever touching my mouse. It's a very fast and
efficient way of working once you get used to it.

But for programs like Aniplayer, Calamus, Papyrus, Papillon, CAB, to name
just a few, there is always the "real" Atari feel available.

The best of both worlds!

>
> As a last word, I'll quote Zerkman, author of CD-LAB: "I hate writting GUIs"

That's a developers problem. As an end-user I don't care about that. I
just want good software. With or without GUI.

3323. SPP 3.1 and MagiC?

Newsgroup: comp.sys.atari.st
Date: 2002-04-14 14:28:27 UTC
From: Kenneth Medin <kennethm@tripnet.se>
Message-ID: <3cb9a0107efd30@tripnet.se>
Source record: 35874

When running SPP 3.1 under MagiC 6.20 I get an error dialog from MagiC
when quitting SPP: Schwerer Fehler -1.

I seem to recall that this is nothing to bother about. Is this true?

If so, is there a way in MagiC to turn this message off? In
Geneva+Neodesk this is possible. Could have been for positive error
numbers when I think about it...

When turning off "TOS comptatibility" I get error -69 instead and also
sometimes "ï¿½berlauf des Systemstapel" to the console followed by a total
freeze. So I guess I have to use "TOS compatibility" to be able to run
Score Perfect at all.

Any other known negative effects with "TOS compatibility" on?

This is on a TT with MAGXBO32.PRG in the AUTO-folder. When running other
programs everything is completely stable. I also run Jinnee as desktop.

Any MagiC and SPP experts who know?

This is not true. When running with NVDI on top of fVDI for the
Galaxy or any other card, all NVDI provides is font/printer handling
and the extended NVDI drawing functions. It does absolutely nothing
else, no screen accelleration or actual drawing. However, fVDI is
pretty damn compatible, although a few bugs still exist, but it's
becoming popular enough that most bugs are being worked out quickly by
the fVDI programmer and the software programmers.

>If the abowe is true then there is really no reason not to order the
>Galaxy graphics card right away I assume...

The Galaxy is an extremely fast graphics card. I beleive that the
graphics chip operates at 100MHz and the whole thing is quite
advanced. I have one in my TT now. The blitting on it is like
nothing I've ever seen! When you move a window around or resize it in
N.AES. the animation is smooth. It seems to do just as well as my AMD
K6-2 450 with an ATI Raedeon graphics card. This is impressive
considering the Galaxy is operating in 1024x768x16bit

>If he gets a few buyers (many TT owners would be interested, I guess) he
>might take the time and finish the Ethernet part as well and get a killer
>product...

There are other ethernet solutions too. If you want an absoutely
killer graphics card for your TT that's still in production and
supported, I'd suggest the Galaxy.

3329. SCSI Ethernet Available

Newsgroup: comp.sys.atari.st
Date: 2002-04-14 17:08:01 UTC
From: John Perez <jhperez@uhunix1.its.hawaii.edu>
Message-ID: <a9cd1hlhu1@news.hawaii.edu>
Source record: 35884

Greetings,

Look at the news item that I just found at Atari.org

--

SCSI Ethernet for Atari now reality
By ST-Computer.net on 2002-04-11

Anodyne software has created drivers for the Daynaport SCSI ethernet cards. The cards and drivers are suitable for Atari TT and Falcon, and also for ST's with a SCSI adapter capable of bus arbitration.

This is indeed good news for those wanting a quick ethernet solution for their Falcon. However, the drivers are only available for Sting and not for MiNTNet/MagiCNet, which drasticly reduces the useability for many people. However such drivers are expected shortly.

More info at the address below.

Link: http://www.anodynesoftware.com/ethernet/main.htm

I was under the impression that IConnect only support dialup conections?
If so that setup will not work. At least not for me.

When using the Apple stack will there be possible to use different IP-
addresses for the emulator and native Mac mode? If so this would make it
possible to match the STinG setup.

On the other hand I assume you can use STinG as well under MagiC-PC.

Yes it mostly works fine but is slower due to the fact it is single
threaded.

Right now I'm using an old Wilhelm Spectrum 1 TC at 1024x768x256 at 69 Hz
with NVDI5 and that is definitly not fast, but works really good.

>There are other ethernet solutions too. If you want an absoutely
>killer graphics card for your TT that's still in production and
>supported, I'd suggest the Galaxy.

I already have one of the Hilgart ROM port Ethernet adaptors. I was
stupid to only buy one when they still were available. So now the TT
thats runs the webserver has Ethernet and I am on a nullmodem 157600 bps
subnet with the main computer. Works fine, but there is still an unused
port in my switch waiting...

I did try his homepage right now but it seems down at
http://gem.win.co.nz/ .It answers Pings but there does not seem to be a
webserver running.

I find that Score Perfect Pro 2.0 will freeze up under MagiC on my
Falcon. Runs fine without. With magiC it loads and then freezes,
so I have to reset the computer.

The message means system stack overflow. Where do you turn
compatibility off? Or is this something that was added after 2.0?

>so I have to reset the computer.

Did some more tests here with both original 2.1 and cracked 2.0. The 2.1 version did freeze MagiC completely here too. Note that I did the installation (where the original floppy has to be in A:) first under TOS but the copy protection seems to make MagiC hang although there is no floppy test as long as the program has not moved around on the harddisk.

The cracked 2.0 did behave exactly like 3.1 above, and was usable. The 3.1 version I tried is the demo without any protection.

I think version 3.2 is not copy protected _and_ is said to work with MagiC in the manual so it would be fine if anybody could confirm that. I am preparing for a MagiC installation for a friend who relies heavily on SPP for his proffessional work. He runs 3.2 and it would help him to not have to reboot when switching from e-mail to music writing.

This is a MagiC thing and is located in the MagiC-Konfig cpx.

3342. Ethernet Questions

Newsgroup: comp.sys.atari.st
Date: 2002-04-15 00:51:10 UTC
From: Brian Roland <BJRoland@bellsouth.net>
Message-ID: <gwpu8.88904$gA5.7246912@e3500-atl2.usenetserver.com>
Source record: 35892

I'm attempting to order the necessary kit to put my Falcon on a LAN
with my PC. These are the only two computers involved at this point.
Is it possible to simply connect the Falcon to the PC via one cable or
must I get a swtich/hub as well?

The setup will hopefully be something like this:

Falcon -> Ethernet -> cable -> USB-Ethernet -> PC -> USB-DSLmodem.

If I didn't already have a USB type DSL modem on the PC I'd just get a hub,
but since I need to go through this PC anyway to get fast NET access...
would this work?

Thanks,
Brian

Directly from cpu to cpu I think all you need is a null cat5 ethernet cable,
or sometimes refered to as a cross over cable. I have not tried that
however so perhaps someone who has can confirm what I read.

I got a gateway/router with 4 ports. Anyone wanting to read how I setup
my Hades060 can go to assemsoft.atari.org and read my doc on the clone page.

You're correct, but the crossover cable is a critical detail.

> I got a gateway/router with 4 ports.

As the OP has a USB DSL modem, this may not be an option; but there is
SOME hope. Check these URLs for information on the (only, AFAIK)
broadband router for USB modems:

http://www.draytek.com.tw
http://www.bestsystemsdirect.com

This product only supports a few USB modems, though, like the Alcatel
SpeedTouch Home USB. If the OP has that model, the DrayTek could be
used with it, and with Ethernet on all local computers. I've not been
following it too closely, but I believe this product's gotten some
pretty good reviews. For instance:

http://www.adslguide.org.uk/hardware/reviews/2001/q4/draytek_vigor2200usb.asp

The only major program that I'm aware of is Calamus, but that's to be
expected since the Galaxy only operates in 16-bit mode, which Calamus
can't work in. I think Phototip doesn't work either. Other than
that, most everything work. I use it with Papyrus, GEMGraph, pm-Doom,
PixArt IV, and a bunch others.

Once Mario's webpage is running there, check out the bug reports.
That'll give you a better idea

>Another post mentioned Jinnee and redraw problems?

I've heard that too, but that doesn't happen on my system. I'm using
Jinnee on top of N.AES and it works like a dream. The only problem is
the transparency effect when you drag an icon. Other than that,
Jinnee runs perfectly.

: Hmm, sounds bad. Perhaps bad PSU? Has it not been used for
: long time? Perhaps the Shifter? Have you tried hitting reset a
: few times?

Greetings,

Well, I swapped out the PSU and Roms, with no change. I'm not sure which IC is the shifter, or whether it is socketed on this board. This particular one doesn't have too many sockets. This really blows, since out of the 4 TT boards that I have, this is one of the two that would run Emagic Logic (thanks to the copy protection). I was really, really planning on keeping this one as a backup for my music system. Now if that fails, I will have to switch to PC (EEEEK!) since so few TT systems run Logic.

Any advice would be appreciated. I wish that I had access to a TT diagnostic cart. Anyone have a spare that they would like to trade for something?

Aloha!

>What you call minor problems may be very annoying and perceived by the
>user as major problems. But I shouldn't have written "crappy", I should

Well, if so, they should contact me about those problems.
I obviously can't do anything about things I don't know about, and
things that I consider minor and that no one bugs me about may well
stay unfixed for quite some time.

>have written " a card and driver which is not supported by most of the
>major Atari software".

But it is, AFAIK, supported by most (GEM) Atari software.

>In a perfect world the installation of a graphic card should be just a
>matter of installing the driver and never have to look back. And that's

I quite agree. Getting there is not exactly simple, though.

>I know that the Nova drivers weren't perfect from day one, but now they
>are... new drivers should be at least just as good, and that's where the

If it had been a matter of simple drivers, I don't think there would
have been much of a problem. Writing an entire VDI/GDOS is quite a
large job, however.

I don't know if the NOVA code was based on anything provided by Atari,
but considering that it was commercial, and expensive, that seems likely.
Getting everything 100% correct going only by available VDI
documentation and existing programs' behaviour is very far from simple.

>problem begins. Most of our software hasn't seen an update in minimum two
>or three years, the Eclipse/Rage II card isn't really supported by this

As long as the software stays with the VDI functionality, no special
support is supposed to be needed. Indeed, very few programs have

problems, IME, and those that do are usually ones that have indeed
been updated recently (or that access the screen directly, although
many of those are fine too).

>software. A Jinnee user might be content when dragging icons over the
>screen with seeing just garbage, I know I wouldn't.

That should not happen unless you use the transparency effect (and I
thought I had fixed that).

>Ofcourse it's faster, the fastest Nova card only contains a MACH64 based
>card with 4Mb VRAM.

I was comparing with all graphics card drivers for all compatible
machines. I've seen a few somewhat faster numbers somewhere, but that
was on an '060 machine, which would have made quite a difference for
fVDI/RageII as well.
It will be very interesting to see what kind of speed the RageII
driver will deliver on a Milan/Hades. The Falcon bus is extremely
limiting whenever anything needs to be transferred to/from the RageII
card.

By the way, the RageII is also using the mach64 2D engine and the cards
sold with the Eclipse have 4 Mbyte memory (and that is not even VRAM).

Actually, the Eclipse/RageII driver used to work fine with the mach64
NOVAs. It's been quite a while since I last compiled it for that (byte
order is different for some things), but it might still work (and if
it doesn't, that should be relatively easy to fix).
I used a NOVA for the early driver development since there was no
Eclipse to try it with.

>As for features.... how does one switch the Eclipse card to ST High

Unfortunately, the hardware accelerated mode of the RageII does not
have monochrome display capability even though it is possible to do
drawing operations in monochrome.
I'll eventually get around to implementing a monochrome mode by doing
mono-expand blits, though.

>compatible resolution? How and with what does one configure the card in
>order to be able using custom resolutions and color depth? Where's the CPX

Getting the calculations for graphics modes correct is not easy, though
it could be done, of course.
640x480, 800x600, 1024x768, 1152x864, 1280x1024, 1600x1200 should be
enough for most users, I think (there are about half a dozen different
refresh frequencies available for most of those (less at the high end)).
If more had been available from inside the Windows setup software for
the card (we cheated and dumped the values set up by that), those would
have been provided too.

>that allows the user to for example switch resolutions instantly, have a

That is not possible, except when using virtual resolutions, since the
AES would not understand what was happening.

>mouse speeder, select a virtual resolution, calibrate the image on the

A mouse speeder has no place in the VDI.

Virtual resolutions would indeed be nice.
It's not on my TODO list, but might get there if I get any requests.

Calibrate the image? You mean gamma correction or similar?
Not on the TODO list either.

>screen etc... Does the Eclipse card support 16 colours? does it support

Hardware accelerated mode does not support 16 colours. It might be
possible to fake it (at a performance hit), or use some old VGA mode.
Who would want it, though?

>320*200 ? How and with what can the user toggle GDOS off/on? etc....

See above regarding different resolutions.

Why would you want to toggle GDOS on/off?
Actually, fVDI has no knowledge of any VDI/GDOS separation. AFAIK,
that was only done by Atari to save ROM space.

>appliaction provides extremely fast 68K emulation. PowerFPU is over ten
>times faster then the Apple 68K emulator and faster then most versions
>of the Motorola FPU chip itself."

I tried SoftwareFPU first (from the same company as PowerFPU - much slower but
freeware), to see if it works on my Mac with MagiCMac 6.2 - it does not!
SoftwareFPU is not recognized by any application running under MagiCMac. :-(
And I think there's no way to test PowerFPU on my system before purchasing it
to have a look if that works better for me; there's AFAIK no crippled trial
version or the like available.

That's my system: PowerMac 9500/180MP with MacOS 8.6 and MagiCMac 6.2.

It would be interesting if SoftwareFPU works on Your system. If it doesn't but
PowerFPU does, the chance is much bigger that it works on my system as well
even if SoftwareFPU does not. :-)

Ciao, Eick

I'm not sure if it'll help, I think Ataris diagnosticas only
reported to screen, but perhaps wrong. It should send to RS-232
if it had any sense, and plug it into to a computer running
terminal software with null modem cable.

3367. Mega ST keyboard cable

Newsgroup: comp.sys.atari.st
Date: 2002-04-15 23:28:07 UTC
From: Gil Parrish <gparrish@beggstelco.net>
Message-ID: <3cbb6723@news.beggstelco.net>
Source record: 35817

The connectors for the Mega ST keyboard cable *look* like 6-conductor phone line modular connectors. Will a 6-conductor phone cable substitute for the keyboard cable?

I have an ST2 and Megafile 30 I just picked up. There was no keyboard cable, so I'm using a 6-conductor phone cable. I can boot to the point where the system gives me a "Drive A not responding" message. Drives A and B seem to be floppies; drives C, D and E seem to be hard drive partitions on the Megafile 30. I have no floppy disks, so it is correct that A will not respond (because it has no disk). But I can't move the mouse cursor at that point no matter how much I move the mouse, and no key on the keyboard does anything when pressed. I'm guessing a problem with the phone cable between the keyboard and the computer. Suggestions?

Thanks.

The diagnostic cart will send to the rs-232 then to a computer running terminal software. Ive done it on the ST with a diagnostic cart but not on a TT since I need a TT diagnostic cart.

Don

Does anyone have a set of ROMs for the TT diagnostic cart or want to trade a ST diagnostic cart for a TT diagnostic cart?

check around and you'll see a bunch of these apps you're looking for.
As far as the cli/gui things.
GUI is awesome, but totally unnecessary for many tools.
Best tool for the best job.
Atari GEM/AES is a big pain in the butt to program and its API is
different from everything else in the world.
Also, depending on what AES the user is gonna use, the programer has to
foresee what would happen.
Just try to write a simple GEM app, insert a field here, click ok, then
display the value in the same window in another editable field.

Then, make sure you can hide/show the window, that it is clean and it
works in magic, singletos, mint. That it supports all resolution/color
depth. That the TAB key works in all OS, that you do the redraw correctly
if you move the window around.

Just to do that, tell me how long it takes you to write such a
simple/stupid program, (which doesn't even do anything).

On atari, what's sad, is that 10% is spent on the logic of the program
itself, the guts, and 90% of the time is spent on the GUI. Which most of
the time don't even work right, which messes up the
tool original functionality.

A GUI definitely has its place, but you can't deny non-gui apps,
especially on machine as low in resources like 1meg of free memory on
16mhz cpu, can't waste that in GUI.

db2 on windows machine, does it really need to be GUI? no, just start it
administer it. don't care, let it run as a service.
Now db2 control center is pretty nice. Yet a lot of windows people rather
do everything via the gui, not as clumsy.

You seem to talk about productivity, which surprises me indeed, as you
just need to get the job done, whatever way, it just got to be done,
simply fast and efficiently with the right tool. CLI fits perfectly the
description most of the time, (unless you use cubase and calamus and all,
which of course have GOT to be gui).

...
> can be labeled as "general productivity" software, which believe it or not
> is the most used , even on this platform. The second shortcoming is far more

> GEMBubble help, GEMScript, ARGV, STGUIDE, WDialog, the AV protocols etc...
> most of these established standards are not supported by the ported apps.
...
ARGV? i thought this was standard on any atari OS, (except old singletos),
anyone to correct me?
Wdialog? :)))))) heheheh, if that was clean and not a hack, it would be
used more often by coders :)
Well, the other protocols, like I said, just try to implement these
protocols, oh, first, find some good detailed documentations, 2 learn
german, 3: people will complain that your program which should have taken
50k is now 2meg and don't work anymore on their machine.
By the time you'll be done implementing all these protocol, you'll be so
sick and tired of your program that you'll drop it.

> The developers seem to think that as long as there is a very basic GEM front
> end in place, the users will be happy, did I mention those damned TTP based
> applications which warp us right back in the stone age?

If it does the job right, who gives a hoot?
You have such a high standard that you rather not use it, eventhough
someone took the time to make it at all available on your atari hardware,
though you can't use your mouse, you'll just complain.

FYI, cli are still being developed in the world, accept that fact.

>
> MagiC and MiNT both know FAT32, and HDDriver is able to partition this type

> no software available to optimize or repair FAT32 partitions.

yeah, big problem there, I understand. But see, if you install ext2fs, or
whatever DECENT FS, you won't have to worry about fat16/32 whatever.
That's the main reason why there are no real defragmenter in unix, coz not
that 100% necessary, systems have uptime of 2 years and performance is
still good.

A while ago
> someone told me different and directed me to a ported MiNT program which

> it a bit more user friendly?

a simple GEM shell :) by all means man, just take the challenge above.
As far as a TTP dealing at low level with your harddrive/fs, it will warn
you several time before doing anything serious.

" YOU ARE ABOUT TO DELETE BLAH"
"Are you SURE?? y/n"
"THE PARTITION IS MOUNTED, IT IS RECOMMENDED
YOU UNMOUNT IT BEFORE DOING ANYTHING,
ARE YOU SURE YOU WANT TO OPTIMIZE IT? y/n"

Well, you get the point.
Besides it's not that the GUI diamond edge never screwed up any of our
drives, right? ;) (even on fat16)

you are just a little extreme, you don't want to "lower" yourself to the
cli level. That's just too bad for you, coz you are missing out on a lot
of apps. Oh well.
Just use whatever is best for the job, that's what I think.

I would bet money that if I did a trace route from Dennis's ISP to my ISP
that more than one of the system admins in between uses a cli to maintain
their system. I find the reference to 'stonage age' hilarious. Such tools
are used everyday. Comedy at it's finest.

Actually phototip is a good example, there are a few free unix apps to pull
the images off digital cameras, completely free! While phototip, which is
pretty and nice, don't get me wrong it works, but it has one flaw, it forces
me to use wdialog, thus making my system unstable. It's a good thing the
unix apps are available, also lynx saved my a** when cab choked, which was
very often...

Some old 520s had external PSUs. If the socket is not a standard PC style
power plug
it has lost its PSU. A replacement 520STFM would probably cost less than the
PSU for the
original ST.

3374. Internet BBS for testing

Newsgroup: comp.sys.atari.st
Date: 2002-04-16 07:50:22 UTC
From: Mark Duckworth <mduckworth@anti-spam.atari-source.com>
Message-ID: <1018943423.102028@pikachu>
Source record: 35826

Hey guys,

I finally finished many things on Octopus. The full details are available at http://atari-source.com. You can test out the bbs by telnetting to matchie.net on port 28. <- Note this is an update on what was previously mentioned on st-computer.net

Whatever you do, don't:
use Telstar.. *sigh*
disconnect your telnet client improperly without logging out

That means if you start to make a new account, finish it before logging out. I tested the bbs with several telnet programs that send out a variety of negotiations and subnegotiations and everything seems to work except good old telstar ;-)

I know it's buggy, but please try to follow these rules that way anyone who wants to test can. This will be up FULL-TIME on my TT030 that sits in the corner doing nothing. It has a serial 115200 connection to the internet. If you receive a connection refused, the BBS is crashed or busy. I plan to implement a simple messaging system which returns a message with "bbs is busy" before finally moving to full multi-node support (cool ;-P)

Take care everyone,

Mark

PS: This will be SLOW on unaccelerated machines (besides TT). The character by character nature of the current code is nearly impossible to avoid :-/

3375. Re: Mega ST keyboard cable

Hello,

in article <3cbb6723@news.beggstelco.net> (comp.sys.atari.st)
Gil Parrish wrote on Mon 15-04-2002 18:28 (-0500):

> The connectors for the Mega ST keyboard cable *look* like 6-conductor phone
> line modular connectors. Will a 6-conductor phone cable substitute for the
> keyboard cable?

I maid my own cable to connect such a keyboard to my Falcon. The 4 and 6
points connectors are compatibles in size. I used a 4 conductor phone
line and adapted one end to suit the internal connector layout.

I still have the original cable and it's a straight pin to pin
connection. You may want to check this with a multimeter (ohmmeter). If
your cable is not like this you may have in the worse case sent the +5V
and 0V to the wrong entries and destroy something in the keyboard.

Bye,
/Pascal/

I recently purchased a cable from RS. Their # 446-664.
This worked perfectly on a Mega ST2 .

Hi Martin,

>My problem is that I'm willing to pay for CAB, but no one wants to sell it
>to me. If software is not free, at least you should be able to buy it
>without much problems.

It's just as easy or difficult to obtain as for example Payrus or Calamus.
You can order an English version from the English ASH distributor Atari
Workshop or get the original German version from ASH.
Both ASH and Atari Workshop (formerly System Solutions) have a very good
track record, after ordering CAB you should have it within one week....

You can also order it from a couple of Dutch Atari dealers but it's very
likely to take longer, whatever you decide to do, do not order it from ACN,
these aren't dealers but a bunch of cowboys....

Cheers from Belgium
Dennis

Hi Janez,

>Well dont get me wrong, but u arent "not a fan" but u lean toward hating
>MiNT.

I don't have to be a fan of it to comment on it, do I? I've seen and read
enough anti-MagiC biased posts here from MiNT users to know this. This is
not about "hating" an OS. It's about what can a certain OS do for me, I've
explained here many times why MiNT doesn't suit my needs, I'm not going to
do it again...

>Those apps are Unix apps and require Unix like OS and IP stack... Some of
>your fav apps indicate VERY clearly that they need Magic to run... Pine on
>other hand will run in Linux, Solaris, MiNT and any other Unix OS..

Give me a break!! Except for the IConnect stack and associated clients there
really aren't that many MagiC only apps around. Most of them will run very
happily under MiNT and/or SingleTOS.

>Small comparision: Apps like Atari irc, Atari icq, Aftp, Amail are
>regarded as MiNT OS apps, but they do work in Magic as well..

You may regard the above mentioned apps as MINT OS apps, but I certainly
don't. These apps are Atari apps in every sense of the word, they run on
the three major used OS's and were developed with Atari in mind...

>On other hand apps like Chatter, Mailer, Iconnect are infact gained toward
>MagicOS.

True, but these apps are IConnect clients, they need IConnect to be able to
run and IConnect needs the MagiC threads to run... I could have written the
same thing about MiNTNet clients, since these need MiNTNet and MiNT. It's
not like only the MagiC clients need their own OS.
BTW: New versions of ASH Emailer now run under MiNT/N.AES...

>Ported apps arent exactly MiNT OS or Atari apps, they are a bonus, a stuff
>u also can do, and they shouldnt really count.

Since they need MINT OS, I regard them as being Atari apps, or are you now
going to tell me that MINT OS isn't an Atari OS?

> So there is no "pushing" toward MiNT OS, but simple necesity, since
>those apps are ported from Unix.. MiNT on other hand offers a way to run
>many of those apps (sadly mostly the ones which dont rely hardly on Unix
>filesystem structure etc...) as .TOS(TTP) apps in TOS or Magic, since any

>GCC compiled app is actualy a .TTP.

Take a look at Anodynes CD Writer Suite, one of the apps from the package is called CD-Inscriptor (CD-ISO.PRG), never heard of it? it's better known to people from the Unix world as MKISOFS 1.2, CD Inscriptor is the living proof that it is possible to add a user friendly GEM front that respects some of the Atari standards and protocols to Unix stuff, does it surprise you that the program works in SingleTOS, MagiC and MiNT?

>Next, there are not just zillion of ftp servers ported, but also drivers
>and processing software for a lot of digital cams (Sanyo firmvare, Sierra
>firmware...), PDF interpreter and renderer, to name a few apps which are
>discussed here a lot.. realtime dictionary also exists (ispell) but again
>it wont work with GEM apps. But that is because GEM limitations...

Because of GEM limitations?
A realtime dictionary should be an OLGA client, making it a snap to add or replace words/sentences in other OLGA clients. Even Drag and Drop could be a solution in certain cases, or at it's very minimum it should be able to do cut, paste, copy to the clipboard.... if iSpell doesn't work with GEM apps then I'm 100% sure this is not the fault of GEM itself, but rather of the guy who ported it and didn't give a damn about GEM, TOS, or even Atari. As long as it runs under MINT OS it's OK, it doesn't even seem to matter how it runs, as long as it runs...

>And also, MiNt is as we speak heavily developed, changes appear almost
>daily, lotsa new stuff is worked on, a lot on "to do" list, new AES is
>also under heavy development... Work on Magic is on ice...

Where does that rumour that MagiC is on ice comes from? At this very moment Andreas Kromke is working his but off developing the new version, like most commercial software the development of MagiC is not discussed in public, it doesn't mean because it's not discussed in public, that it's on ice or dead...

>Fans like MagicNET auther etc does indeed push things forward, and is only
>to ba happy about, but basicaly atm, Magic seems to be in dead end...

Well Janez, luckily things are not always the way them seem...

>BUT MiNT is not only ported apps, or apps noone understand.. Remember,
>that main usage of MiNT is with AES after all (NAES or XaAES).

I've never said that MiNT is only about ported apps, I'm very well aware that it can run the mainstream of Atari apps, but that's not the issue, if it would be any different then one couldn't call it a Atari OS in the first place.

>All protocols u mentioned works without any problem in MiNT OS, with
>exception of GEMScript. And feeling of "Atari computing" is very vell
>preserved, more as in Magic which does have strong influence from Mac.

I *KNOW* that they work, but they are *NOT* implemented, as far as these apps are concerned the protocols are non-existent, it took 17 years to get

where we are now, and those bobo's are throwing us back to the early '80s. Well, excuse me but I like working with apps that use these protocols, so far nobody here came up with a good reason except for Adam who told me that it's not really easy.... that's an excuse which isn't good enough. I know that programming isn't easy, if it was, we would all be programming...

>And yes, adding GEM shell is not easy... Porting app means to recompile
>source (since Unix apps are usualy distributed in source form) on your OS.
>Novadays MiNT OS has good library etc, so porting of an app usualy is
>only matter of downloading it, depacking and typing "make ********"

If ported software is equal to rudimentary presented apps, then forget all about making the MINT OS more popular. Anodyne has proven that GNU software can be presented and run in true Atari fashion on a Atari on whatever OS the user chooses to use, coincidence or not, but Anodyne is a commercial software house...

>Adding GEM shell means writing an application.. And for u, using a GEM
>shell is to trust programmer he didnt make a typo when coding GEM shell.

That's the main reason for beta software and betatesters...

>>I'm a brave man, but I'm not crazy. Risking my data if I make a typo in
>>the command line? NO WAY!!! Is it really so difficult to write a simple
>>GEM shell? If someone goes through the trouble of porting software why is
>>it so difficult to make it a bit more user friendly?
>
>1st of all, a typo which erase all data is domain of Hollywood movies.
>Next, i did use GEM and CLI based apps which mingled with HDD and for BOTH
>i did read docs...

The GNU application in question is called dosfsck 2.4 and was ported by Frank Nauman himself. Yes, I read docs, but unfortunately not all docs deserve to be called docs. The 6.4 Kb text that is included with dosfsck hardly qualifies as a doc... considering that this is an app that has to handle sensitive data, that doc is almost unusable. Furthermore is also assumes that the user knows what all the technical terms mean. Have you ever seen the manual of Diskus?.... *that's* a manual.
If everyone here who uses The Edge would send you 1$, you would accumulate a nice sum. Why? The Edge messes up VFAT partitions and can't handle any of the newer partition formats, on the DDP website there's a very good English program available which is featurewise far more better then the Edge but it looks very crappy. The people here keep on using The Edge... could it be because The Edge has an informative GEM interface, and is easy to operate? oh yes.... and it looks rather pretty also ;-)
Don't get me wrong... I'm not saying that The Edge isn't good, all what happened to it is that the development ended and that it's outdated now. Someone still using normal AHDI compatible partitions can use it, as far as implemented features and reliabilty are concerned it's still among the best. I used the Edge as an example because it's a typical Atari program, it's easy to use, has a transparant user interface, and offer reatime help. That GNU application mentioned earlier looks like pure crap compared to it,

I'm not saying it's crap... just that it looks like it. Ask any typical Atari user with what type of apps he prefers to work, or better yet look at those dollars come pouring in...

>GEM dont make u expert.. and its easier to click on "zeroing partiton" as >to type whole such word...

After I clicked "zero partition", it will ask me at least once to click the "Are you sure?" dialogbox...

>CLI is way from stoneage... Infact a lot of GUI OSes still dont have >many things CLI does have.. and they would benefit a lot.. CLI is very >diferent as GUI, and it does rely on typing commands, but that does not >make it obsolete and stoneaged.

From where I'm sitting it is stoneage... no matter what, you wont get me back behind the keyboard typing commands again on this Atari. This baby came standard with a GEM and a mouse... in 1985 Atari set a new standard, standards are ment to be improved, but you're suggesting here that we should leap back in time...

>What make it look shitty and odd is actualy GUI's handling of TTP apps.. >Small dialog with no explanations etc is crapy...

I agree, and anyone porting anything like this and expects me to use it needs his head examined.

>U do think to narrow here... ported apps do add functionality to GEM and >do not threat "Atari feeling" Of course not all of them. But if i can make >network related stuff remark, NFS is great stuff.. i love it, and i know u >would.. its transparent and u use your OS same as u did before.. u just >can have direct acces to HDD's in your lan, or even remote machines.. next >X server is also cool..

Has it ever occured to you that a lot of people (probably the majority) do not use LAN and feel the slightest need to access a remote machine with their Atari? There's more in life then networks...

>and again in MiNT fashion (try to preserve Atari feeling) it allows to run >X applications in GEM. A GEM window popup and contain X application.. No >need to run strange Xwindows GUI etc.. Data exchange betwen GEM and X is >kinda working, and planed to be better and easier...

It seems to me that we both have a different outlook on what exactly the "Atari feeling" is...
Tell me, in what way is using for example Pine different on a Atari then it is on a PC or Mac running Linux? where exactly is the "Atari feeling" when working with Pine? except that it runs on a Atari under MINT OS only, there is no "Atari feeling" in sight. It can't interact with other Atari programs, doesn't have the look, feel and handling either. To summarize: it's an UFO.

>I see no problem of running Knews instead Newsie in GEM. Or if someone use >linux server, running Netscape etc from remote machine? I agree, its not >an Atari app, but atleast u can still sit behind your beloved machine,

>using beloved apps..

But this way you degrade "the beloved machine" to just another client is a server network. That "beloved machine" deserves a whole lot better and it is capable of a lot better as well.

>Again, u seem convinced MiNT OS only use those ports... MiNT OS can use >exactly same application u use (xcept the ones which require Magic), use >same protocols (VA, DHCP, OLGA, DnD (u can drag stuff to Unix apps as >well), ARGV, Bubbles, STguide... work in AES does not differ at all.

Once again: BUT THEY DON'T !!!!
Except for the fact that they run under MINT OS, they lack and show a total disrespect for any of these protocols. Name me one ported MINT application that has a handfull of these protocols implemented....

>Last but not least, someone bothered to port a tool ppl realy need.. Now >that tool dont have nifty icons and so ppl dont apreciate now.. Lets kill >the bastard, how he has the guts to offer a tool without GUI.. Better be >without it..

It seems to me that the main reason these apps are ported over is only because the porter needs them for personal use. The fact that some of these apps can be usefull to others is not the issue. What is important to remember is not to tell us everytime that whenever someone asks for a certain app that it is already here... That iSpell dictionary for example may be already here, but it is unusable with the mainstream Atari apps, so it isn't here at all... all what's here is an app ported by someone who needed this for personal use. I'm not about to the kill the bastard for this, but surely I'm not going to nominate him either.
If that famous "to do" list contains nothing else then similar stuff that is only usable for a few, well yes, then we are better off without it. Because right now the (false) impression is given that in a short while from now, we'll have all the software we can dream off, GNU is the magic word....
A couple of years ago there was a lady here who told me time and time again that "TOS is now MiNT, let's move on...." I've repeatedly asked her what way, finally I know... this is not moving on but going backwards 20 years.

>Unix apps parallel with GEM.. I dont see any harm or bad thing on that..

Did I suggest otherwise?
You didn't understand the point I was trying to make. My post didn't have anything to do with Atari apps not running under MiNT, I know that almost anything runs, although, some don't always look and act like the programmer intended, but that's the fault of the AES in use, not MiNT.
I replied to Adam's post in which he basically tells us that the ported software is going to save us... it might, but not the way it's presented to the users at this very moment. Unless a program offers the look, feel and handling which we've grown accustomed to over the last 17 years, it will never become very popular and used only by a small minority. I'm convinced that the biggest majority of Atari users are not willing to trade in their

GUI and the associated protocols. We deserve better then command lines or
apps running in TOS windows.

Cheers from Belgium
Dennis

Asante also makes a SCSI to Ethernet adapter for powerbooks. I wonder
if the same driver would work on the Asante since SCSI is a standard.

3384. 800XLDJ (SIO2PC software) on a TT?

Newsgroup: comp.sys.atari.st
Date: 2002-04-16 15:54:11 UTC
From: rodsmith@speaker.rodsbooks.com
Message-ID: <ldhh9a.6m9.ln@speaker.rodsbooks.com>
Source record: 35834
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit

Hi,

I've recently gotten an SIO2PC cable (to link an 8-bit to a standard RS-232 port on a PC or the like), and it works fine with the basic DOS software on my x86 laptop; however, I'd prefer to use it with my Atari TT. There's a package called 800XLDJ (http://wwwstud.ira.uka.de/~s_tomczy/dj800.html) that's intended for this purpose, but it's written for STs, with a Falcon version also included in the archive. Unfortunately, both the ST and Falcon versions lock up my TT; they both display a menu bar and a window for selecting disks, then the system locks up (the mouse pointer freezes). The documentation's in German, and so isn't much use to me. Does anybody have any suggestions or tips? Thanks.

: Martin Tarenskeen

I got it working. It was one of the nasty side effects of trying to
install EasyMiNT, which I would rather be using, on a hard drive with 411
megs available. That was not enough, and strange, really strange, things
happened to my boot and communitation partitions, and Sting was one of the
things that died. I am certainly getting a lot of practice at reloading
programs.

It used to be that a unix-type installation was about 10 megs. 411 megs
was not enough for the X-Windows stuff. I will try that project again
after I get caught up on my e-mail.

I will look for DEVSET.PRG. Thank you

Jim

That brand was tried before, the project was halted and they are considered "not so good". It could be due to a lack of documentation perhaps but as far as I know they are not supported. In someways that is too bad, those are all over the place, very easy to find.

Had similar problems with two older TT:s (with TOS 3.01). I tried and
took out the TT RAM and then MagiC runned perfect on both. Now MagiC runs
fine on one of them _with_ TT RAM. The other still only with ST RAM.

Interersting was that the same (original) TT RAM only worked in one of
them.

Just now I'm actually coping the MagiC 6.20 installation floppies from a
third TT (with HD floppy and the one I'm writing this with) to one of the
others TT's via my STinG network using BNET. Thanks to the backgound
floppy functions it works pretty well.

Hello John Perez,

For my latest trick, somehow - Magic runs on one of my TT030 machines, but
produces a Gemdos error and crashes on the other. I took the hard disk
from one, swapped it back and forth, and inexplicably, Magic refuses to
run on one of the machines.

Are the DIP switches the same ?

Are the TT ram cards the same ?

Not a chance... Unfortunately

I bought one of these asante adapters in an effort to start writing a
driver for it, and I can't get any of my atari's to even boot with it
connected. According to Asante, it won't work if it is addressed faster
than 1.5Mbps, which I think machines like the TT and Falcon can
surpass, so best to consider one of the other numerous ethernet options
available to us now..

That's funny. I just picked up a Mega ST2 without a keyboard cable as well :) What I did was get 2 6-pin RJ11s (which I had) cut the ends of an ethernet cable, and crimped the RJ11s on the cable using 6 wires rather than 8. I also had a crimper. Took me 2 minutes.

Joshua.

I was reading through the Cubase Audio manual today, trying to
remember if I saw this once before, or if it's my imagination. But,
isn't there a way to launch Cubase Audio so only the CUBASE (ie. MIDI)
portion of the program is run - as if you were just running regular
Cubase, and not Cubase Audio?

I can't remember, is it something like holding down ALTERNATE or
CONTROL when launching the program???

Source record: 35750

Hi all,

at the moment iï¿½m working on a mixermap for Cubase Audio on the Falcon
for my "new" (second hand) Roland JV1010 module. Alas the guy i bought
it from didnï¿½t have the CDrom with the Sounddiver software and Midi
implementation. I downloaded some other editing software for my PC,
seems to work. But for midi/audio iï¿½m still working on this "dead"
platform...
I have some controllers up and working, like volume, pan, reverb and
chorus send, filter cutoff, resonance(!) etc. per channel.
The sysex messages like reverb type, reverb time etc. i copied from a
JV1080 mixermap i found at Steinberg.de. It seems to work, but every
time i get a fault message in the JV1010 display indicating a checksum
error.
Any sysex experts out there?

Greetings,

Freek.

But it should be noted that a genuine Atari UNIX _does_ exist. I don't
think it really got finished but was to be shipped with TT's.

And off course the BSD clone Mint is nowadays a far better "Atari UNIX",
I suppose.

Depends on what sort of webserver program you run. If your site is not
hosted on your own computer you will have to ask the administrator where
it is located.

Hm, .exe sonds like a Neodesk program. Are you trying to get a desktop
feeling on your home page? :-)

If you wamt to run executables on the visitors computer this should not
be possible at all. But, actually it is under certain circumstances.
Microsoft are trying hard to eliminate these feature, though.

I find this discussion very amusing/interesting. But isn't it time to
rename the thread's subject name ? "cli vs gui" or "GNU vs Commercial
software" or "MiNT vs MagiC" or whatever ;-)

P.S.
I'm using pine now and MiNT. I have no opinion about MagiC - I have
never used MagiC - but I do know some of the best Atari apps were written
with MagiC in mind. I just don't want to use two systems, and MiNT has
become my (personal) choice.

Can you give an example of such a sysex message that is entered in a
mixermap object, and gives a checksum error on your JV1010 ? I might be
able to see what's wrong with it.

(Maybe you should post this question also in a midi related newsgroup like
alt.music.midi)

3404. Cubase Audio - extra MIDI OUT Options

Newsgroup: comp.sys.atari.st
Date: 2002-04-16 21:18:24 UTC
From: nurmix@spam-free.com
Message-ID: <3cbc9540.7849511@news-server.socal.rr.com>
Source record: 35757
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Ok. I've recently updated my studio, adding another synth module and table top sampler. So, the need for a second MIDI OUT port from my Falcon was obvious. I've had the MIDIman "Mini MacMan" box, that works through the Falcon's LAN port (using a special MROS driver) for quite some time, but never used it much, aside from testing it when I initially got it

Anyway, I got everything hooked up, and re-routed things in my MIDI patchbay. Everything appeared to be ok. Cubase launches, loads the MROS LAN port driver, after which time I plug in the Mini MacMan (since as the README file states, if you have it plugged in BEFORE the MROS driver is loaded, your Falcon basically won't boot or work).

The problem is, with it up and running, I'm getting very frequent multiple-bomb crashes while recording MIDI data. And for the record, I'm only using the Mini MacMan's MIDI OUT. All incoming MIDI data goes through the Falcon's standard MIDI IN port.

I tried running CAF under both HD Driver, and ICD Pro, and disabled _everything_ , but the crashes remained. The only thing that stopped them was unloading the MROS lanport driver, and disconnecting the Mini MacMan. So unfortunately, this solution for an extra 16 MIDI out channels isn't going to work for me.
:-(

My question is, what are my options now? What other device can be used with the Falcon and Cubase Audio to add an additional 16 MIDI out channels _reliably_?

I figure I'll be looking in the USED market for any solution to the problem, although I seem to remember discussion of some sort of serial port MIDI OUT expander from Mario Becroft; or was that ONLY for STs?

If there aren't any other options for me, I suppose I could break out the old STE, and run normal Cubase on it, synchronized to the Falcon running Cubase Audio - but this would hardly be an ideal solution! Or, if there's a viable "ST/STE-only" MIDI OUT expander, I suppose I could just use the STE for MIDI/Cubase again (although I no longer have my monochrome monitor!). This wouldn't be too bad actually, since I'm no longer using the audio portion of Cubase Audio with the Falcon. I've recently switched over to SoundPool's Audio Tracker.

Thanks for the help in advance!

Hmmmm, well:
Isn't mkisofs under GNU GPL license??
If so they are (I believe) bound to release the code of their application.

Anybody to check if they are breaking the license?

Not correct, one can cut/paste to and from PINE to any other app. Also one
can click URL's and cab loads the page, click email addresses and amail pops
up ready to send to the address. Sure these are features of TosWin and
StringServer, but they enhance and integrate into whatever unix app or ttp
you have running. I get the distinct impression people who dislike unix
or ttp apps have not seen or used a MiNT machine correctlty setup.

The "Atari feeling" is meaningless if the app partially works. PINE is a
dam nice app and it out performs anything on the Atari I've seen to date.

I've never used, let alone serviced TTs. But, if you can't find
anyone I will try my best. They're generally a ST with 32 bit
bus, some extras here and there, from what I understand.

>driver for the FA8? If yes, where can i get it?

It should work if you set the Mixer output BUS correctly. The FA-8
(and the JAM 8 Out, which I have) don't need any special drivers to
work with Cubase Audio.

You will find BUS selectors in various places in Cubase Audio:

- For each channel in all mixer maps
- For the effects outputs in mixer maps
- AUX sends in mixer maps
- In the HARDWARE SETUP where you can assign the Falcon's analog
output to any BUS.

BUS 1 = FA-8 outputs 1 & 2
BUS 2 = FA-8 outputs 3 & 4
BUS 3 = FA-8 outputs 5 & 6
BUS 4 = FA-8 outputs 7 & 8

So, for example, you can send a channel to one output only by panning
it either left or right. So if route a channel to BUS 4 and pan it
fully right, it will appear on FA-8 output 8. If it were panned fully
left, it would appear on output 7.

I hope that helps. It took me a while to figure it out when I got my
JAM 8 Out!

From gnu.org FAQ
"
You have a GPL'ed program that I'd like to link with my code to build a
proprietary program. Does the fact that I link with your program mean I
have to GPL my program?
Yes. "

Is Anodyne's program just a GEM shell calling mkisofs.ttp seperately?
or have they somewhat integrated the 2 together into 1 executable?
Moreover, mkisofs.ttp could be renamed into plugin.dat or whatever other
filename to fool the user into thinking it is not just a GEM interface.

That is not good example.

Mkisofs (IIRC) is GNU GPL software, and any other software that uses (link
againsrt) it, or part of it must be GNU GPL too (GPL states that clearly).

So if any program from CD-Writer Suite uses it then it uses it illegally,
and shoult be relased for public under GPL terms.

As I belive, Annodyne Software would not do such illegal asctions, and that
measn that CD-Inscriptor must be written FROM SCRATH.

It got finished but was only available for registered developers. It's
an Atari System VR4.

> And off course the BSD clone Mint is nowadays a far better "Atari UNIX",
> I suppose.

No, it isn't. The Atari Unix is a *complete* Unix with all System VR4
features, including X11 and Motif. MiNT is not Unix, only Unix-like.
Nowadays it's Linux that replaces Atari's Unix.

Actually I have not used it for several years. I have never tested
programs on it with respect to MiNT, since this is not possible. Unix is
not MiNT.
And from todays point of view running Unix on a TT does not make much
sense anyway. The TT is simply too slow.

This is wrong. If, for example. someone writes a GUI for mkisofs and the
GUI just calls mkisofs with command line options, this usage of mkisofs
is absolutely legal and compliant with the GNU GPL.

>

I assume you want it to run on a PC.
You could use a normal href tag eg <a href="url/program name.exe">, this wont acutally run it on your web page but it will allow the user to run it from a seperate window on the desktop. Alterantively you could try embedding it into a web page using the embed tag, eg...
<embed src="url/program name.exe" width=size in pixels height= size in pixels/>.
This will place it on the page although I don't know if it will run, I just tried it on my pc however I did not have the correct plug in (I assume that one exists) for IE in order to run it.
If all else fails you can simply go back to the site that was running the spectrum games and look at the source for their web page to see how they did it.

Okay - so if anyone's listening...

As I think back, the last thing that I was able to do with this TT was testing simms. I've been trying to weed out the defective ones.

It is slightly possible that the last time I tried to boot, one of the simms was not seated completely in the TT ram board.

Can anyone think of what I may have fried if this was the case?

Also, would a TT diagnostic card and test rig be likely to be able to diagnose this?

Thanks!

John Perez

There's also NetBSD for Atari:

http://www.netbsd.org/Ports/atari/

I don't know the pros and cons of NetBSD and Linux with specific respect
to the Atari platform. On other platforms, each has its quirks, but they
mostly boil down to personal preference issues.

> Uwe,
> just found this NG after looking at my STE in the loft.
> Does the STE (4Mb RAM, 250Mb SCSI HD) have enough bottle to run Linux?

No -- at least, not without modifications. You'd need a 68030 board (with MMU; no "EC" CPU variant). I don't know about precise RAM requirements for the 68030 version, but you might need more RAM than 4MB.

> If so, where would I get a copy - available for download?

If you've got the requisite hardware, check:

http://www.debian.org/ports/m68k/
http://ftp.us.debian.org/debian/dists/Debian2.2r6/

There's also some guy selling CD-Rs on eBay for $10, but I don't know how complete and useful these are. You'd need to add a CD-ROM drive to take full advantage of this, I'd expect (unless maybe you set up some sort of network link and did a network install, but I've not tried that with Ataris). Type "Atari Linux" into the eBay search field to find these CD-Rs.

> If not, what alternatives are there?

Minix is available for Atari STs (or was; it might be hard to track down), and doesn't require much in the way of resources. It's also pretty limited, though.

One of my greatest regrets was not being able to buy the dev machines. Back
in 94 a programmer who had been involved in the project was given the 2
development
TT's which he sold for some pitiful amount of money like $600 US. I was
just about
flat broke at the time. 2 TT's, Atari TT mono big screen monitors, Rieble
ethernet cards
in both... oh well...

From what I have heard over the years though. The Atari version of Unix
while not that
bad at the time, would be considered utter junk these days.

Well you could make them work, but the effort probably wouldn't be worth it.

I had a couple myself. I was able to get my TT to boot with them, it's a question
of termination. Of course they are old boxes so you really need to verify that they work in the first place.

I was able to get quite a bit of information off of the box in it's sector 0. However that's
not actually implementing it.

Here are a few random things on these boxes.

The unofficial word is that there is no one at Asante who has any idea how these things work. The last programers involved with the project left years ago. But you won't get anyone at Asante to make this statement officially. I really don't know why they care, it's
old technology and I think the market would accept a blanket, we don't support these at all anymore statement.

They don't follow the standard scsi command structures. I've spoken with a few programmers who have looked at how the boxes work and they play fast and loose with SCSI commands. So much so that it's easier to get some other method of ethernet going than this system. To be honest this is probably why they don't work with Macs after a set date. Apple changed their SCSI chips. So if you have a mac with the old scsi chip in them they work. I think this would be comparable to the idea of LineA in the atari world. It was accepted and pushed for a number of years and then the Falcon came out and it was all over with.

>I don't know if the NOVA code was based on anything provided by Atari,
>but considering that it was commercial, and expensive, that seems likely.
>Getting everything 100% correct going only by available VDI
>documentation and existing programs' behaviour is very far from simple.

In less then a month this is the fifth time NOVA graphic cards are described as being expensive... I bought a NOVA Mach32 card with 1Mb in 1994 from ComputerInsel and paid DM 499 for it. At that time the bare ATI card was advertised in various PC mags costing DM 399. So for DM 100 more I received a VME to ISA interface, casing for the interface, drivers and a very well written manual. And in addition all the various NOVA drivers updates were free... Two years later I bought the NOVA Mach64 with 4Mb VRAM for DM 999, the bare card was advertised at that time at DM 900... Personally I find $50 extra for the interface, drivers and manuals to be a bargain. One thing is for sure: Gerhard Huber couldn't retire with the little he made off selling those cards... Everyone seems to overlook that the ATI MACH32 and 64 cards can't be compared with cheap taiwan made S3 cards. The ATI cards were expensive back in 1994-1997, they were also regarded to be among the best available. Quality usally comes with a price attached....

Cheers from Belgium

Hi Frederic,

>Atari GEM/AES is a big pain in the butt to program and its API is
>different from everything else in the world.

So are the Windows and Mac API's without the proper tools.

>A GUI definitely has its place, but you can't deny non-gui apps,
>especially on machine as low in resources like 1meg of free memory on
>16mhz cpu, can't waste that in GUI.

This is 2002, expand the memory and/or replace that 16Mhz machine with a Milan or Hades. Low resources are not an excuse in my book. We've all had plenty of time to upgrade our machines... nine years to be precisely.

>ARGV? i thought this was standard on any atari OS, (except old singletos),
>anyone to correct me?

So what's wrong with it? it doesn't matter how old it is, fact is that even that standard isn't implemented in the ported apps. It's like standards are a sleeyzy four letter word in the world of ported apps

>Wdialog? :)))))) heheheh, if that was clean and not a hack, it would be
>used more often by coders :)

Yep, they rather waste their time reinventing the wheel...

>Well, the other protocols, like I said, just try to implement these
>protocols, oh, first, find some good detailed documentations, 2 learn
>german, 3: people will complain that your program which should have taken
>50k is now 2meg and don't work anymore on their machine.
>By the time you'll be done implementing all these protocol, you'll be so
>sick and tired of your program that you'll drop it.

I gues that's the difference between coders and programmers... It's also the diffence between free software and shareware/commercial apps, one pays the programmer a reward for not getting sick and tired of implementing a user friendly interface which works with the protocols.

> applications which warp us right back in the stone age?
>If it does the job right, who gives a hoot?
>You have such a high standard that you rather not use it, eventhough
>someone took the time to make it at all available on your atari hardware,
>though you can't use your mouse, you'll just complain.

I for one give a hoot...
Do you remember why exactly you choose an Atari computer at the time? I was already an Atari addict when the ST was released, but for a lot of people the ST was their first computer. They could have opted for an Apple, PC, Amiga and a couple of other platforms. I don't think anyone choose it because they loved the hardware, it was the software that set it apart...
17 years old software looks better then what you and your gang are trying to shove up my a*** right now!! In those 17 years the software development has risen to a level which even today still makes it worthwile to stick to this platform. And like it or not but the fact is that the protocols and standards raised the overall quality of the software. We've all accepted standards like Drag and Drop or the Clipboard, some of us even welcomed them... I consider the online help of ST-GUIDE to be invaluable, especially compared to crappy text files which are supposed to help the user. Colour icons? who needs them? why have I ever bought a Nova Card? RSC constructors? A waist of time. OLGA and DHST? That's for lamers wanting to show off.... etc. :-(
You want us to return to the stone age, the only reason given for this so far is that the bunch of people who port software aren't capable of producing a user friendly and more or less good looking interface...

>>well, actually there is a problem. There's no software available to
>>optimize or repair FAT32 partitions.
>
>yeah, big problem there, I understand. But see, if you install ext2fs, or
>whatever DECENT FS, you won't have to worry about fat16/32 whatever.

I run MagiC 6.20 with FAT32 and it works for me...

>That's the main reason why there are no real defragmenter in unix, coz not
>that 100% necessary, systems have uptime of 2 years and performance is
>still good.

So how do you fix bad sectors?

>PowerFPU costs $29
>
>No, that's wrong. The price is $75.
>Have a look at at the developers web site:
>
> http://www.jna.com/orders.html

I bought it from the local Apple store, since software in Belgium is not
exactly cheap I assumed $29 was the general price. So this means I've got
myself a nice bargain without realising it.... :-)
$75 is a lot of money for a tool like this, personally I would have to
think twice before ordering it at that price. For $75 you can get a second
hand 604/300Mhz processor which will speed up the emulation process quite a
lot as well.

>It would be interesting if SoftwareFPU works on Your system. If it doesn't
>but PowerFPU does, the chance is much bigger that it works on my system as
>well even if SoftwareFPU does not. :-)

I'll download it tonight and report back tomorrow....

>that more than one of the system admins in between uses a cli to maintain
>their system. I find the reference to 'stonage age' hilarious. Such tools
>are used everyday. Comedy at it's finest.

So what's your point? I'm not responsible for whatever it is our ISP's work with. Typewriters are still in use as well, but you wont get me behind one anymore...

>Actually phototip is a good example, there are a few free unix apps to pull
>the images off digital cameras, completely free!

Phototip is much more then just an app that pulls images off your camera, and since you've obviously used it you know this very well. None of the free unix apps will offer the same features. And I don't give a damn if PhotoTip isn't free, it's not like it costs an arm and a leg. One usally gets what he pays for, the money factor is a silly argument....

>While phototip, which is pretty and nice, don't get me wrong it works, but
>it has one flaw, it forces me to use wdialog, thus making my system
>unstable.

Oh no!! another one !!
I'm using Wdialog and/or the PDLG.SLB for years now, none of my systems are instable. But I do read docs, WDialog is an extension for TOS, which also happens to work on MagiC without causing any problems. MiNT isn't mentioned in the docs, at the time is was developed (1995) the brothers Behne probably weren't even aware that MiNT was being further developed. I find it rather normal that they didn't waist time and energy trying to get something running under MultiTOS.
To summarise: WDialog was never intended to run under MiNT, no guarantees whatsoever are given. Anyone persisting to run it under MiNT knowing that it makes his system unstable is a stupd git. If you need to run an application that needs WDialog revert back to SingleTOS or MagiC. And last but not least, stop sulking, you're a programmer, write a replacement that works under MiNT.

>It's a good thing the unix apps are available, also lynx saved my a** when
>cab choked, which was very often...

Yes a very good thing.... who needs CAB, Wensuite, Adamas or even Highwire when there's such a *free* marvell like lynx available?

Take a look at the NV-RAM settings, boot preference *must* be set to TOS, in
my experience it's also better not to use an oversized boot partition, some
versions of Magic behave strange when booted from anthing larger then 256Mb.

Cheers from Belgium

The sysex messages in the mixermap controls have thew following format:

Reverb type
F0,41,10,6A,12,01,00,00,28,XX,00,F7

with XX being the variable controlled by the mixermap knob. Of course
itï¿½s
hard to compute the checksum if you donï¿½t know the value of XXï¿½

Perhaps it would be possible to do a "fake" dialup with IConnect on a
SLIP nullmodem network as you can using the Windows "Dialer"?

Well, my STinG setup is of course also fully capable of using several
connections simultaniously. CAB on the other hand opens one file a time
and is afaik single threaded. Both when online and from the cache or
other local files.

I would really be surprised if CAB suddenly would run with each GIF etc
decoded in separate threads when used with IConnect!

Dennis,

You can hate CLI's but you are missing out because of some misguided notions about unix.

The best example of MiNT with the unix extension I can provide is PINE and Newsie, or some other GEM mailer/news reader of your choice.

First of all you don't need to open bash (bash is a CLI) and type any commands to start PINE. You can start it from the Taskbar or place it on the desktop like any other app. If you think there are long complex commands involved in stating unix apps you are sorely mistaken.

Once PINE is started you simply press arrow keys/return or one letter keys to do whatever it is you wish to do. Want to compose a mail, press "c". You do not sit at a CLI and enter "send mail blah..." and anyone who thinks otherwise is a complete moron.

Further more any good GEM app has keyboard shortcuts for all commands, thus making it functionally equivlent to PINE. The only difference being the look of it, and the fact that PINE does way more than most GEM apps.

One can use MiNT with the unix exensions all day and never type a complete command (more than 1 key stroke). The lumping of "unix apps" and "cli" into the same category is wrong and misguided. The real use of unix commands is only really apparent in bash which IS a CLI. Programs like PINE or Lynx are not CLI's at all.

I cannot explain it in any simpler terms, so if it still don't sink in I feel sorry for you.

If I'm not mistaken here, WDialog is free. But unfortunetly sources are not
avialible. If it would be relased (GPL :), then it would be fairly easy to
implement it everywhere. Without sources it isn so easy.

Btw. there are replacements, but none of them implement WDialog functions in
full.

>>still good.
>
> So how do you fix bad sectors?

There is a big difference between filesystem checker and defragmenter.

Filesystem checkere checks filesystem for errors (and bad sectors if needed)
and tries to repair this problems.
Filesystem defregmenter takes action to defragment files on disk. You have
to keep in mind that defragmenter should run only on 100% error free
filesystems becouse if filesystem has errors it can die completly after
defragmentation. Becouse of that most of defragmenters are able to check
filesystem for errors first, and some of them are able to repair it.

For examle: Diamond Edge is a combined defragmenter and checker.

In the "Object Definition" dialogue try the "SysEx Func" popup menu and
select "Std. Roland Chksum."

This is supposed to get the checksum added.

I used Magic few years and i still use it sometimes on ST, since Magic
works great on low mem setups.. In contrast with most MiNT haters which
usualy never used it, or didnt managed to install it, and ofcourse thus it
sux....

MiNT is more, it is unix like design specially for atari
with a lot of compatibility of other OS, for read&write harddrive,...lan
compatibility...
the sparemint is the support of rpm too.
Some development are the fruit of cross-compilation.
It still exist a free gem implementation of gcc tools....

The best course of action is to delete wdialog and the app the requires it.
Locate a free unix alternative and save your money. Booting back to
singletos is like jumping into the stone ages. hehe I agree reverting back
to magic is a step backwards if you have alot of stuff networked.

I agree with u...I also think they never used good setup.. Maybe a
glimps at MultiTOS which realy aint good... Too much problems... And last
but not least: i never talked ported unix apps use GEM cookies.. I just
said MiNT OS use then and we can run basicaly anything Magic/TOS can with
bonus in form of Unix :) But ass soon some ppl see "Unix" that means some
obsolete CLI to them (like DOS).. They only know its typing of commands..
Noons see the piplelined commands, interprocess communication, which
basicaly can do much as those GEM protocols try to... GEM scripter is
"GEMized" wersion of SH anyway...

I'm a little curious of the benefits of Pine. Most of the Linux people
seem to use the newsreader slrn.

The only features in slrn I miss here with Okami is "message quality"
where slrn puts the most "interesting" posts first in the list. Really
don't know how this is done but would anyway be nice to have as they say
it works...

Also Okami dosen't highlight threads with responds to my own messages. Is
this possible in Pine?

Okami has no built in support for Unicode 8-bit characters at all. Lately
this has become more frequent and would be an interesting feature. What
about Pine and Unicode (UTF-8)?

I really like to be able to view several messages at a time in different
windows. I suppose Pine can't do that?

Also to have multicoloured messages with each posters text in different
colours makes it very easy to se who wrote what in Okami. What about Pine?

In short, should I setup MinT here and use Pine or should I stay with
Okami?

This sound a bit unfair to me. At least with rescent MagiC versions there
is no need for WDialog. On the contrary WDialog has made it possible to
run programs that use its extensions on my Geneva setup without having to
by MagiC at all.

If WDialog istelf were commercial it would have got your point. But as it
is free you are free to use its benefits as a user or programmer. If you
find it buggy then stay away from the programs that needs it.

But naturally it would be even better if the WDialog sources would be
released so others could port and correct its errors.

>to magic is a step backwards if you have alot of stuff networked.

I have all my Ataris networked here with MagiC and Geneva and it works
great for my needs. Sharing drives and ftp'ing to/from Windows and so on.
I have not tried the Samba compatible client yet but it would make it
even simpler to talk to my Windows pc's.

Dennis,

>> 17 years old software looks better then what you and your gang are trying to
>> shove up my a*** right now!!

Who is forcing you to do anything? Be happy with your limited magic setup,
everything is optional you know. As swe pointed out the mac just finally
got a CLI and it really pleases the power users. If you prefer to be a
power luser that is your decision, but just because you dislike something
does not make it old or outdate. I dislike magic, I have since day one
but I don't diss miss it as utter crap or useless or outdated. If it works
for someone fine. If you (Dennis) don't like what you are reading stop
reading it, you have been in my killfile for the past month. I'm only
reacting to bits and peices of posts requoted by others. Now if you
have to read a TXT file to place me in your killfile, what a pity it
probably won't get done and you can keep on reading my posts. lol

Maybe it's not a Magic bug, but an Atari bug? Maybe Y2K bug ? There are
patches for fixing Y2K bugs on Atari computers. I don't remember the
correct URL but you should be able to find it with Google or some other
search engine. There is a special Atari-Y2K-bug website somewhere.

I had Atari 130 XE and 1040STE many years ago and I forgot if you can do
that or you need one of the monitors (color/mono)
if yes, are there PAL & NTSC versions of ST computers ?

I'm in Canada in thinking about buying ST, STF or STE computer again

please let me know guys

I had much trouble running Pine on my standard 14 MB Falcon: In
combination with accs/thing/other processes running/ I frequently ran out
of memory. And PINE is not even a GUI. MyMail and AMail never gave me
memoryproblems. Now, with my CT2b and 32MB fastram, I don't have such
problems anymore. Conclusion: also apps without GUI can use/waste lots of
memory. MiNT loves a lot of memory.

Hmmmm, weird, pine even worked on 4 meg machine, so on your 14meg, that's
very strange indeed. Weren't you the one on the mint list who had weird
problems also with shutdown and fpu auto thing? if so, I think you
fixed it all, did you try pine since you fixed your setup problem?
(if it was you of course).

Hi Dennis,
I don't want to get bogged down in the other aspects of this thread - they all miss the point - but I'm glad to endorse the statements and opinions in your opening message here.

I know I'll be leaving the Atari platform this year and it'll be a result of alienating so many of the really talented and selfless programmers we've had on this platform as much as the lack of an adequate hardware and user-base fails to support any kind of professional programmer.

regards
Harry

Hmm I liked both...

Star Trek for it's optomistic and moralistic viewpoint.. typical American!!
(no offense to Americans meant, it 's just your TV sometimes is a little
parohcial sometimes, hmm our UK TV seems to be heading in the same
direction!) (and yes I have lived in the States)

Babylon..... just a bloody good story... excellent acting , well told...

By the bye am enjoying Enterprise, anybody else like the change in style?

Nick

All ST's up to and including I think the Mega STE have RGB out and the frame
rate can be set to 50 or 60hz,
so if you have a TV with an RGB SCART socket then you should be able to
connect any ST to it. However
when I tried this recently it did not work. It appears some SCARTS have auto
switching
between RGB and Composite and something on my SCART lead triggers the TV
into thing the
input is Composite not RGB... I have had some suggestions on how to hack the
lead but instead I
dug out my trusty Philips 8832 RGB monitor and used that.

STFM and STE computers come with a built in RF modulator and so can be
connected directly
to a TV. I assume these came in both PAL and NTSC, though judging from the
picture
quality on my STE the PAL version is more a hacked NTSC. Again I think there
was a modification
to correct the levels into the modulator. STs with a built in modulator also
have composite
present on the monitor connector, so you can feed any TV with a VIDEO In.

If you just want to play games the TV Out is fine, however for anything else
you either need a
proper monitor like the 8832, or an Atari Monochrome Monitor, or the adaptor
lead to let you drive
a SVGA monitor as if it were a mono monitor. Note most games don't run in
mono,
but many professional type programs require it...

Hope this helps

Actualy, it WAS the hardware... I got ST very soon after they came on
market and there was very little apps.. But 68000 on 8Mhz, YM and Shifter
capabilities was more as enough for me and a lot of ppl to buy... And in
those early days hardware sold the ST.

> 17 years old software looks better then what you and your gang are trying to
> shove up my a*** right now!!

And what he or his gang (me) are then? If u dont have the basic
decency, how do u expect any smart reply? U will now also start to bash
black ppl or jewes?

> In those 17 years the software development has
> risen to a level which even today still makes it worthwile to stick to this
> platform. And like it or not but the fact is that the protocols and standards
> raised the overall quality of the software. We've all accepted standards like
> Drag and Drop or the Clipboard, some of us even welcomed them... I consider
> the online help of ST-GUIDE to be invaluable, especially compared to crappy
> text files which are supposed to help the user.

Please, stop bashing things u have NO idea what they are!!

DRAG and DROP u said?

"grep SWE Mail_addresses | pico" This will look for ALL lines which
contain strin "SWE" and send result
to app called pico (text editor)
Note, this is very simple example
and already do stuff u would need
a lot of mouse action to drag....

ST-GUIDE?

"man dosfsck" MANual pages, UNIX CLI version of
online help! Good and coprehensive
and a LOT better as those TXT files
If u would read it, u could use it!

Colour icons? who needs them?

"-rw-rw-rw 1 jvalant wheel 1264 Mar 14 18:24 Mail_addresses"

This one for SURE reveal a LOT more
Info as let say coloured and even
Animated mailbox icon.. to get info
click few times, to get info on
more files, click to death

> why have I ever bought a Nova Card?

Because u need BIG resolution to put all icons and windows on.. and even
so, im sure u move them and overlap a lot!!!

and DHST?

Simple CLI history can cover that!

> You want us to return to the stone age, the only reason given for this so far
> is that the bunch of people who port software aren't capable of producing a
> user friendly and more or less good looking interface...

It just so happen that those ppl are good programmers u are ONLY one to
question their capability! Also Unix and CLI knowledge is prefered and
WANTED in basicaly all high tech etc dev labs etc.. Stone age? Yeah, esp
those at universitied and NASA etc... I dont have ANYTHING against u dont
wana use CLI.. but calling us morons and ppl who does port and a lot of
those even programm stuff for US (could be for u as well) lamers,
stoneagers, not capable is moronic! If u are stupid so much u cant run one
CLI app which requires ONLY TO RUN IT WIHTH DRIVE SPECIFIED (since in that
case it check for errors automaticaly OR add very mystic and secret "-a"
option, "a" as "automatic") dont blame CLI for that.. As u see, i DID read
dosfsck MANual pages!

> I run MagiC 6.20 with FAT32 and it works for me...

Really? So why u are in search for defragmenter??

> >That's the main reason why there are no real defragmenter in unix, coz not
> >that 100% necessary, systems have uptime of 2 years and performance is
> >still good.
>
> So how do you fix bad sectors?

They rarely happen.. If they do (usualy after crash etc) automaticaly
at boot file consistency checker is runned and it looks for eventual
probs.. Same things happen after XXX boots.. in 6 years i didnt lost a
single file yet..

Now a question for u: Why even Windows and MAC OS (NT OS/X) turned
toward Unix and CLI consoles?? Apple after 18 years of GUI finaly got
that GUI is by FAR not all???

Janez

Hello,

As far as I recall, there were Pal/NTSC versions. If you want to hook
up a ST to a TV, you need either a STfm or a regular ST/STe and
something like a piece of hardware called a Video Key.

oh my hardware is plenty fast, just think about the true atari feeling
users that still have their 8mhz ST that don't/can't upgrade.

You misunderstood my statement here.
It is standard, that is, it is automatically supported by ALL
applications, especially in the unix apps (.ttp) without doing any
modifications.

>
> >Wdialog? :)))))) heheheh, if that was clean and not a hack, it would be

If the wheel is square, hell yes, it is best to reinvent it to make it
round.

<snip...>
> > applications which warp us right back in the stone age?
</snip..>

Funny, as everybody else in the industry think the opposite.
MacOS out of ALL the GUI OS is now unix core with tools (yes! CLI, for
macusers, yuk!!! right?, what are they thinking???).

The constant rise of linux a little bit everywhere.
Windows even still have not dropped their cli window.
What are THEY thinking. (morons you must think).
TTP have been part of atari since day one. Unix (stoneage to you) has been
around for 30 years, and many more years to come. You think it's a
mistake, I just think good design don't go away that easily.

> I for one give a hoot...

actually the software was weak, the hardware and price was the attraction.
Nobody really used GEM, just a shortcut to start games for 90% of the
users.
It was a cheap alternative to mac. Price/speed made the difference.

> 17 years old software looks better then what you and your gang are trying to
> shove up my a*** right now!!

look better?
To that I say, who cares? as long as it does the job.
What do you do with your application???? you use it or just look at it
all day because it's beautiful???
I use it, that's what it's meant for.
This is getting a little ridiculous. Next time you gonna tell me that all
applications that don't use Anti-aliasing fonts are not worth your while.
Whatever... Such a high standard to your own inconvenience.

<snip>...

My gosh dude, what do you do other than when you're not complaining and
not staring at a GEM application?? How about your take some little time
and convert .TXT or .man/.cat into html or .stg or .hyp?
How about that? everybody will be happy, you included.
Be useful somewhat. You don't even need to be a coder, as someone
already has created a conversion tool to make the process a little easier.
How about that?

Why did you buy the Nova card?? i hope not for the RSC icons!, I just hope
to do some graphic design for example? or have a good monitor with high
refresh rate at high resolution maybe? I don't know, you tell me, you
bought the card.

> You want us to return to the stone age, the only reason given for this so far
> is that the bunch of people who port software aren't capable of producing a
> user friendly and more or less good looking interface...

whatever dude.
It wouldn't be porting anymore, it would be re-writing or writing extra
code. Different matter here.

I just checked the Radio Shack website; they do not list a 446-664. A search on "6-conductor" pulled up 4 hits, being 2 for in-line couplers, 1 or 100' of wire (no connectors) and 1 for a 6-conductor phone jack. Perhaps the catalog numbers and product lineup are different in the UK than in the US?

Yes. It should work even with a (probably easier to find) 4-conductor
cable. The +5V and Ground conductors are doubled on the 6-conductor
cable, and one can live without that.

>are used everyday.

Indeed, in some cases a CLI is indispensable because some tasks
are easier done that way, especially when large bulks of data have
to be manipulated or the operation is complex. I would say that a good GUI
and a good CLI should complement each other on a good computer system.

My (personal) feeling is that unix-like CLI commands are too terse
for comfortable use; on the other hand with some CLIs on other OSes
the user converses in what almost appears like plain English, e.g:

$ COPY/LOG [MIKE]*.DAT/CREATED/BEFORE=YESTERDAY [JOHN]*/OWNER=ORIGINAL

copies all .DAT files from directory DAVE which have creation date
before yesterday to directory JOHN, but keeping the original file-ownership,
and logs each copy operation on the screen.

Ok, I know that some people prefere the two-letter command sequences
of unix shells, some other prefer plain English- it should both be
as legitimate as liking to click upon a row of buttons in a GUI.

>Cubase, and not Cubase Audio?

Through trial and error, I was able to answer my own question. For those of you who are interested in disabling the "audio engine" in Cubase Audio; simply holding down ALTERNATE when running CAF will cause a dialog box to pop up, asking if you really want to load Cubase without the audio engine.

For those of you wondering WHY I wanted to do this, basically because I was doing some testing to see if the MIDIman "Mini MacMan" MIDI out box would work better (ie. Cubase would STOP crashing) if the audio engine was disabled.

Another reason for wanting to do this is when I'm just working on MIDI stuff, I don't always want to have to turn on my DAT [so Cubase can get it's clock information] - it likes to complain if it can't find a clock signal through the FDI. And even if it's only MIDI tracks that I recorded previously [WITH the DAT turned ON], the tempo plays back erradically with the DAT turned OFF, since CAF is not getting any clock signal at all this way.

Cool! It definitely works, but I think the driver is conflicting with something in my system, which is causing Cubase to crash randomly with the Mini MacMan connected when recording MIDI data. I've run a completely 'clean' system too. Maybe it doesn't get along with the Nemesis (whether it's ON or OFF)?

I'd be curious to see how it works out for you though.

>How are you likeing Audio Tracker?

So far, it's very nice. I'm still getting comfortable with it, but it seems to handle multiple audio tracks much more quickly than CAF - although it needs to take over an entire partition to create it's own special "tape" format on the drive. I don't mind because I have a drive with several empty partitions that I use for recording anyway.

And this "tape" format allows for faster recording and playback in the end. Plus you can export everything as .WAV or .AIF files when you're done anyway. And, the interface is nice too, and it works well in color, with professional and modern looking 3D dialogs.

It has a lot of sound file editing features as well, although I haven't gotten into that part of the software yet. And it can import Cubase Audio arrangements if need be.

Overall, some things about it and the way it handles audio tracks are similar to Cubase Audio, but other things, in my opinion, are better. One thing about Cubase Audio that always seemed a little overly complicated was the whole distinction between "parts", "events", "segments", "lanes", "channels", etc. It just seemed unnecessarily convoluted and inefficient to my brain. That's something they've changed and made a lot better in Cubase VST from what I understand.

I would have to say that Audio Tracker was worth the money (it was only around 65 US dollars). By the way, I ordered it directly from SoundPool - they simply e-mailed it and the manual to me.

Your Mini MacMan didn't come with a cable?

I guess it's just a standard "Apple MAC serial cable", although it might be considered an "AppleTalk" cable? I bought the interface used from a guy a long time ago, and the cable came with it, so I never had to go looking for one. I would think any computer or electronics store that deals with MACs could help you out. Just take the interface with you and look for a cable that fits. It's the same on both ends (8 pins/male connection) with one of the pins slightly offset from the others.

Checking the MIDIman web site, it says it's a MAC serial port connection. Go here:
http://www.midiman.com/products/midiman/minimacm.php

Keep in mind that you also need the MROS driver. If you e-mail me, I can send that to you:

Hi All

With the PC and Atari releases of the Hotz MIDI Translator technology, I decided to create a forum. Questions are welcome and I will do my best to answer them, or just plain discussion on translator techniques.

Go here to join:

http://groups.yahoo.com/group/midi-translator/

Here is the description:

=====

Welcome to the Hotz MIDI Translator Forum. The Translator technology was created by Jimmy Hotz in the late 1980's and is continued today by Accordance Music Systems. This forum is for discussion of the PC as well as the Atari Translator system. For those lucky enough to have Hotz Boxes (Controllers for the original Atari software)techniques can be discussed in using this instrument with the software. Since the Translator system can be complicated or as easy as you want, questions are welcome.
=====

You can download a demo of the PC version here:

http://www.hotztranslator.com

For info and the freeware download for the Atari version you can go here:

http://tamw.atari-users.net/hotz.htm

Hope to see you there!

Tim Conrardy

3497. Desktop picture in MagiC?

Newsgroup: comp.sys.atari.st
Date: 2002-04-18 01:37:16 UTC
From: John Perez <jhperez@uhunix2.its.hawaii.edu>
Message-ID: <a9l80caqg1@news.hawaii.edu>
Source record: 35701

Greetings,

Try as I might, whenever I attempt to load a background image in .IMG format into MagiC on my TT030 with either a Cyrel Sunrise or Nova graphics card, the palette for the image gets crazy. I have tried both cards in each of their color modes (Cyrel 8-bit/32-bit - Nova 8-bit->32-bit). Is there some secret that will help solve this mystery?

I am trying to use Imagecopy to convert the images, and cannot determine the correct combination of settings that will create an image that I can use.

Alternatively, anyone want to send me some nice background images? All that I have are the built in MagiC patterns which are too small.

Thanks,

John Perez

3498. Imagecopy, Cyrel Sunrise, and green skinned women

Newsgroup: comp.sys.atari.st

From: John Perez <jhperez@uhunix2.its.hawaii.edu>
Message-ID: <a9l85caqg2@news.hawaii.edu>
Source record: 35702

Greetings,

I was testing a Cyrel Sunrise video card in 32-bit color mode, and whenever I load am image, the palette is skewed in on direction or the other depending upon the settings in Imagecopy. Generally, skin tones turn to green, or blue. I cannot seem to determine the correct settings to allow normal colors.

Perhaps Imagecopy doesn't work in 32-bit color, or NVDI needs some setting that I am unaware of?

Thanks,

John Perez

Star Wrek? the CASH COW of paramount who can't think up a new idea at all? The same outfit that put out Deep Snore 9 after they TURNED DOWN Babylon 5 saying there was no way a space station idea would work? The same outfit that when Babylon 5 started getting better ratings they pulled every dirty trick in the book to try to kill off the Babylon 5 show and FAILED!

Star weak, the outfit that in all the years it's been on has only had ONE hafeway decent space battle? Who designeds ships that any kid with a slingshot could knock out of orbit? The same people who for the most part will almost never show a non-human that isn't just an energy ball or a gass cloud or a overgrowen snow flake?

The Shadows Battlespiders ships could wipeout all of Starfleet in about 30 seconds and no star fleet ship could ever stand up to the Vorlon Planet Buster ship.

Star trek fans tuck their tails and run and hide when a Whitestar Fleet jumps into their space.

The old Adaptec 4000 and 4070 boards easily supported 2 MFM or RLL drives. It
just required a seperate cable for the extra drive, plus a new cable with 3
connectors instead of two. It would be much easie nowadays to just track down
a 1 gig scsi drive for around $20 and replace the whole MFM/4000 adaptec
board completely. I wouldnt even try cramming another oldr MFM drive into that
case.

Linux on the Atari requires an 68030, so an ST/STE will not work.

It's not very much different from running Linux on your Atari.

> Nowadays it's Linux that replaces Atari's Unix.

I beg to differ. I have Debian running on my TT and it's horrendously slow, unefficent and hardly usable except in text mode.

On the other hand, Debian's Riebl drivers are A LOT more stable than MiNT's, which allows me to still use the TT as a file server and printer spooler, but not much else.

MiNT is overall a better UNIX choice for Ataris, if only for being optimized for Atari hardware. Unfortunately, MiNT's software collection is of extremely uneven quality and, in the case of that crapy Riebl driver, has made me look elsewhere for my computing needs.

Note two things: 1. Copying this software and giving away the copy is
not legal. (As far as I know the firm who wrote the software for Atari
still exisists.) 2. A TT with resolution TT high is required. Atari's
Unix does not run on any other machine.

Yeah.
So, if anyone wants to have that Very Complicated GUI for dosfsck.ttp
program under MagiC, it is below. Cut it, save as "dosfsck.sic", edit
the pathname in line "dosfsck = "C:...." to point correctly at
dosfsck.ttp program (or place dosfsck.ttp in C:/tools/) and you
have your graphic shell. Of course I take no responsibility for
its reliability... :-) To use it you need ASH Scripter, Jinnee (the
best Atari desktop) and form.plg by Alexander Clauss.

Have fun.

BTW I will not say ANYTHING about the subject of this thread.
It's pathetic.

Sorry there is no HYP manual available yet, but I will do my best
to prepare it soon.

MagiC is now TOS, so let's move on, shall we? ;->

Don't bother to fix it, just replace it.

If someone here don't give a keyboard for free I sell ST keyboards for £5
plus post or a Mega STE remote keyboard for £10 plus post.

If Parcelforce damaged a properly packed parcel they will pay for the
damage.

Hi Frederic,

>Hmmmm, well:
>Isn't mkisofs under GNU GPL license??
>If so they are (I believe) bound to release the code of their application.

I believe that believing is something which one should practice in a church, not in a newsgroup... they don't have to release anything, if they choose to write a commercial GEM front end, that's their business. Furthermore Anodyne makes it very clear that MKISOFS is bounded by the GNU GPL licence, it's not like they claim it's their code...
But you've missed the point, the point was that it's no problem at all to adapt some of the GNU packages to run in a userfriendly way while respecting some of the Atari standards at the same time. And they even managed to make the program run under SingleTOS, MagiC and MiNT. If all you can say to that is "Hmmmm", then I think it's about time to wrap up this discussion and move on to the next one :-)

>>except that it runs on a Atari under MINT OS only, there is no "Atari

Hi Frederic,

>Is Anodyne's program just a GEM shell calling mkisofs.ttp seperately?

Yes

>or have they somewhat integrated the 2 together into 1 executable?

No

>Moreover, mkisofs.ttp could be renamed into plugin.dat or whatever other
>filename to fool the user into thinking it is not just a GEM interface.

But it isn't...

Before you start accusing Anodyne Software of doing anything illegal, you
better get the facts right first.

Anodyne Inscriptor 1.2 folder:
Version: 1.2
Dated: 31 July 2001

CDISO.PRG CD InScriptOr v1.2 program
CDISO.RSC CD InScriptOr v1.2 resource (English-language)
COPYING GPL license for MKISOFS.PRG
LISEZ.MOI French-language version of this file
MKISOFS.PRG MKISOFS v1.2 GNU program under GPL license
READ.ME This file

In the docs Anodyne makes it very clear that CDISO is only a GEM front that
calls up MKISOFS.PRG (the famous GNU application), The files COPYING and
LISEZ MOI are the actual English and French GPL licences.

But since you're obviously so interested in the application, let me tell you
that it sucks. The only usefull option is the ability to burn CD's in Joliet
or Rockridge format which is a feature missing in the SoundPools CD Rec Pro
package. Apart from that feature CD Rec Pro beats the shit out CD Inscriptor
time and time again, and that's been put very mildly...

Cheers from Belgium

I wondered if you are still interested/you still have the time to
maintain "native" fVDI drivers??? Please note I have nothing against
you not maintaining them but I would just like to know:
- if old "native" drivers are compatible with recent fVDI (beta)
releases;
- if you plan to do an "official" release (with up-to-date docs & all
working drivers in a single archive) soon;
- if the API between main fVDI program and drivers could now be
considered stable;
- and if you could perhaps consider putting "native" drivers source
code under some CVS tree somewhere (AtariForge comes to mind)...

Again I do not force you to do anything on that matter, nor do I
promise to help on fVDI drivers coding (in case I would be able to and
had the time), but I think the current "stalled" situation as regards
"native" fVDI drivers could be improved a bit that way...

Regards,
Guillaume

Thanks Paul & Richard! Yes, the Mini MacMan came with a cable. I guess I need to take another look at the Falcon. I didn't remember the LAN port looking like the MiniDIN. Yes Paul, I'd like the MROS Driver, I'll email ya. I've gotten the Mastering stuff from soundpool. For $69.00ish, I guess I'll have to try Audio Tracker!

I'll let you know how the Mini MacMan works out for me. I'll be trying it first on my CT2B Falcon, which, by the way, has been running great since I sent the MB to Rudolphe in France to fix my bad installation. If it works there, I'll try it on my Nemisis Falcon to see what happens. My Nemisis Falcon is destined for a CT60, when it gets here. I hope I won't have to remove the Nemisis for everything to work properly. I'll also probably be recasing that Falcon into another case.

Hi,

the German Atari ST book "Scheibenkleister II" has a section about adding a second drive to the SH205. There is a detailed instruction about how to do it. The disk which came with the book contained the necessary driver, if I remember right.

If you understand German, just drop me a mail and I'll scan the pages.

> clock signal at all this way.

Yeah. My problem has been the Soundpool mastering software has not
been able to see the 44.1 clock signal from the little steinburg CAC
clock, and I have to plug in my FDI to work with it. But since I don't
have a DAT, I've gotta use the CAC to run CAF. I've been thinking
about finding a cheap (ha!) used DAT for convient mixdowns, but I've
also been looking at the cheap CDRecorders, and wondering if CAF could
be used with one? Do you think CAF could get a 44.1 signal from a
CDRecorder? (I expect it depends on the CDRecorder!) (BTW, I use a
FAD-8 for A/D recording/conversion.)

From: <>
Message-ID: <1019144588-967467AEicMi@ntlworld.com>
Source record: 35727

Hi all,

Trying to clear the decks of some accumulated stuff (see Tip of the day,
http://www.myatari.net for a sample of how things can go over the top...)

Anyway, I've got:

Syquest EZ135 removable media drive plus ten carts 55UKP
Atari SC1435 colour monitor, great condition with swivel base and cover 30UKP
PageStream DTP package plus manual 10UKP
GFA Basic V3.07E, disk plus manual 8UKP

The remainder are a fiver apiece:

Diamond Edge V2, disk plus manual
HiSoft TruePaint manual only
HiSoft TrueImage manual only

Books:

Atari ST series Concise 68000 programmers' reference guide
Compute! Tech Ref Atari ST Series 2 - AES

You collect the monitor from Watford, Herts or arrange courier - the
remainder include postage to UK destinations.

Cheers

3530. Re: can you hook up Atari ST directly to a TV ?

Newsgroup: comp.sys.atari.st
Date: 2002-04-18 18:03:59 UTC
From: bm827@FreeNet.Carleton.CA
Message-ID: <a9n1qf$mr7$1@freenet9.carleton.ca>
Source record: 35731

Every STFM has a Modulator built in (hence the "M") which can be used
in two ways: 1) RCA speaker-type plug at the back used with a cable and
a Computer-TV switchbox so popular with the Atari 2600, 5200, 7800,
Commodore 64, etc., connected to the TV input; 2) line outputs on
pin 1 (sound) and pin 2 (composite video) [if I remember correctly]
of the Atari monitor plug, which can be hooked up to your VCR or
modern types of TVs.

The STF only had a Floppy ("F") and does not have any modulation built in.
There was a product called the VideoKey to fill this need.

The STE has a TV output plug like the STFM, but I don't know if it
has the same line output capabilities on the monitor plug.

To the best of my knowledge, you will only be able to use LOW and MED
resolutions on your TV.

Hope this helps.

3532. Re: 2 drives in SH205

Newsgroup: comp.sys.atari.st
Date: 2002-04-18 18:17:01 UTC
From: bm827@FreeNet.Carleton.CA
Message-ID: <a9n2it$nq2$1@freenet9.carleton.ca>
Source record: 35733

Actually every Atari hard drive has this capability, including all
the Megafiles.

You need a second MFM drive (for the SH205 or Megafile 20) or RLL drive
(for the Megafile 30 or 60), a second 20-pin cable, a 34-pin cable
with three drops, a second internal power cable to power the hard drive,
and finally hard drive utilities that will recognize LUN 0 (your first
drive) *AND* LUN 1 (your second drive). AHDI will *NOT* do this, but
Supra hard disk utilities will.

I heard that the first controller in the SH 204/205 (i.e., ACSI to SCSI)
could be used as a straight SCSI controller but I never had any luck
with this. I would be interested in finding out if it's do-able, though.

Hope this helps,

3540. Seagate Baraccuda drives

Newsgroup: comp.sys.atari.st
Date: 2002-04-18 20:31:25 UTC
From: Jim DeClercq <jimd@panix1.panix.com>
Message-ID: <a9naetrvf1@reader1.panix.com>
Source record: 35740

My project is to get a bigger drive into an old SCSI box,
apparetly from a quite old Macintosh machine, for reasons of
EasyMiNT.

For reasons that seemed good at the time, I bought, cheaply,
quantity eight, from what were said to be tested good pulls
from machines being scrapped, of Seagate Barracuda ST32550W,
2.1 gig drives, 68 pin. I have an adapter to fit 68 pin drives
to a 50 pin cable, so that should not be a problem. I got pintout
for this from their website, and did everything right. And then
tried all the wrong things.

Regardless, SCSI seemed to mean System Cannot See It, although
any other of three smaller and 50-pin drives I have on hand,
when plugged into the same box I was trying to put a 2.1 gig
drive into, were properly recognized by HDDriver, latest
version.

I connected an LED to the proper pins, and that little sucker did
not go out, as if the drive did not initialize itself properly.

It just cannot be that all those drives, now in a garbage dump
somewhere, were all defective. They just did not work for me,
and are now gone.

Does anyone what sort of gremlin I ran into here? What could I have
differently? After all, I was not trying to boot from it, and it had
two different connector to use in setting its address with jumpers.
Neither one or both connectors made any difference. Looked like
good drives to me, although quite noisy, compared to a TT.

What happened?

Jim

Di you get the 68 pin to 50 pin adapter that includes the high byte
termination? The adapter has to terminate the extra 18 lines that are unused.
So you may be having the drive still thinking it is in wide mode right now and
not narrow and so it is acting as if it is completely unterminated.

Because you don't just ask a question, or make a statement. Every word you write in an Atari newsgroup is flame bait.

3552. Keyboard Cable Pinout

Newsgroup: comp.sys.atari.st
Date: 2002-04-19 00:48:58 UTC
From: Gil Parrish <gparrish@beggstelco.net>
Message-ID: <3cbf8f00@news.beggstelco.net>
Source record: 35597

Maybe the question I should be asking is-- what is the pinout for the Mega ST keyboard connector? Specifically, which is power and which is ground? My keyboard's light doesn't come on when I power up, so the keyboard doesn't appear to be getting power. I have a multimeter, so with the pinout I can tell if the computer connector is bad, if the 6-conductor phone line I'm using instead of a keyboard connector is bad, and (if neither of those are true) that the keyboard is bad.

Thanks.

: Di you get the 68 pin to 50 pin adapter that includes the high byte
: termination? The adapter has to terminate the extra 18 lines that are unused.
: So you may be having the drive still thinking it is in wide mode right now and
: not narrow and so it is acting as if it is completely unterminated.

Thank you very much. The darn things were way too loud anyway, so
I will not miss them, but now I have one less 68-50 adapter, and

just took as good a look as I could with CAB at TMC's java web page,
and what they sell has active high byte termination. The one I took
apart does not have a pullup (or down) resistor in it, so my guess
is that it did not have high byte termination. I had completely
forgotten about that. One cannot depend on anyone else doing the Right
Thing, and terminating unused lines.

Just for the heck of it, I will try a local computer store that
has a few such adapters hanging on their display board, and if
they are the right kind I will get one. Still have, I find, one
of those eight screaming drives that has not yet been trashed,
and I would like to see if that is really the mistake I made,
because if so, I might have some 80-pin adapters that will not work
either. Hard to tell, on a two-layer board. At least there is a
pullup resistor present.

FWIW, TMC is The Mate Corporation, and they make adapters and
cables for SCSI use, as a specialty. They should work fine,
if you remember to order the right things.

By hindsight, I should have asked for advice first.

Now, is there a way to get one of those noisy 7200 RPM drives to run a
little quieter, without blocking its airflow?

Thanks again for catching my silly mistake.

Jim

Your adapter might not terminate the unused 8 data lines, which can
cause problems. Also check whether the drive requires to TT to provide
initiator identification. If you have not already done so, enable this
in HDDRIVER.

It was quite expensive, BTW. On a Maxtor 230 MB SCSI drive I paid more
than EUR 2000 for it about 10 years ago.

Hi Paul,
I thought I'd pass along a tidbit of info regarding Cubase crashes.
Although I was not running anything but Cubase with a vanilla boot-up
on a Falcon (and no other hardware), it suddenly started crashing
immediately after trying to load a song or selecting a name for a new AIF
recording. The culprit was ICD boot settings. Max logical sector size was
set (after a re-partition) to 32768 but the "In System" size was 8192.
Changing the max to 8192 fixed the problem (at least it looks good now
but without much testing).

3564. Speedo GDOS fonts floppy

Newsgroup: comp.sys.atari.st
Date: 2002-04-19 10:33:37 UTC
From: Martin Tarenskeen <nospam@zonnet.nl>
Message-ID: <Pine.MNT.4.31.0204191226120.46-100000@easymint>
Source record: 35608

When I bought my Falcon 2nd hand it came with 2 shoeboxes full of floppies. I found 2 floppies with the original Atari Speedo GDOS distribution. I use NVDI so I didn't need Speedo GDOS. But the second floppie contained a standard collection of Speedo fonts. Unfortunately the floppie was severely damaged and more than half of the files unreadable. Does anyone have this font collection. Since it is part of the Atari history, I'd like to have them on my system. If someone is willing to mail them to me ? (Since I already own the floppy I think it's perfectly legal)

Samba works very well as I can confirm.

Its command set is the same as that used by FTP and get used to a TTP command line - once Vassilis gets it integrated into BNet it'll be fantastic.

Cheers

3573. New Atari group on Yahoo: atari-midi-programming

Newsgroup: comp.sys.atari.st
Date: 2002-04-19 19:09:36 UTC
From: g.goebertus@chello.nl
Message-ID: <3cc06cd4.14796861@news.ams.chello.nl>
Source record: 35627

Hi all,

I have started an new atari related yahoogroup:
atari-midi-programming.
The idea is to create a forum for all MIDI/AUDIO programmers to
discuss ideas or problems, and to share knowledge, so that we don't
have to reinvent the wheel time after time.
As with every Yahoogroup, we have an archive of 20 MB for examples,
listings, tips and so.

Group homepage:

http://groups.yahoo.com/group/atari-midi-programming

Group email:

atari-midi-programming@yahoogroups.com

To subscribe send a blank email to:

atari-midi-programming-subscribe@yahoogroups.com

| Ok. And this has to do with Atari how?...

It giving people a chance to chat for a start, and the Enterprise used TOS based computers , mucho superior to the Babylon 5 Amiga workbench based system. 8-)

This does not mean that the IBM OEM drive will also work. If this drive requires the MegaSTE's host adapter to generate parity information, for example, it will not work. The specs do not say anything about this. It only says that the drive generates this information, which is normal.

Hi Lonny,

>If you (Dennis) don't like what you are reading stop reading it,

Why should I? I'm enjoying myself... and let's be honest, a thread like this beats one like the ST vs Amiga hands down...
Furthermore, threads like these are necessary, while you and some others here float on your little white clouds, more and more people are running away from this platform. It's absolutely necessary that someone airs a different opinion then the one that is being aired here constantly. It was about time someone came foreward and woke up a couple of sleeping dogs. I'm used to put my foot in it here so I guess it had to be me...

> you have been in my killfile for the past month.

Well it seems to me that unless *you* stop reading here then there seems no way to avoid my drivel is there?, which just goes to show that a killfile doesn't always work, not even Pine can avoid, me brightening up your days :-)

>I'm only reacting to bits and peices of posts requoted by others.

Really? then one of my postings must have slipped through your killfile since you directly replied to it in message B8E2257E.6494%gfa@basic.net , posted on 16.04.2002 at 19:01:18....
I don't want to brag about ASH Emailer Lonny, but a slip-up like that will *never* be made by my preferred mailer... :-)

Cheers from Belgium

Hi Kenneth,

>>...and people wonder why ASH is disliked. I certainly am not sulking.
>>The best course of action is to delete wdialog and the app the requires it.
>
>This sound a bit unfair to me. At least with rescent MagiC versions there
>is no need for WDialog.

Ofcourse it's unfair, but I didn't really expect a different reply. WDialog is *the* example for MiNT users to bash... They overlook the fact that Wdialog works perfect under SingleTOS, Geneva and MagiC. Three out of four isn't that bad if you ask me... but then I know a couple of MiNT users who use Wdialog and never experience any problems with it :-/
Atari produced a couple of hundred special computers, these contained a custom build "anti-ASH" chip, and by pure coincidence all these computers ended up in the hands of MiNT users, that explains why all ASH software and anything that bares any resemblance they ever tried sucks...

>If WDialog istelf were commercial it would have got your point.

Even if it was commercial it wouldn't make any difference, take a look at all the commercial software you've got, you'll have to search hi and lo to find one manual that will not find one that guarantees you the application runs under MiNT... The truth is that the AES can't cut it, a nice example is Papyrus, the toolbar contains coloured icons, guess how they they look under MiNT? Ask any Calamus user how long it took before there was a version that worked the way it was supposed to... etc.

Now brace yourself... tomorrow I'll be flamed from here to eternity, but these are the facts, the defence will be in line with something like " who needs a coloured toolbar" and Calamus is a dirty hack". There's a lot of software that looks rather "weird" or of which certain features can't be used, it's not because of the OS, but because of the AES, I know a couple of programmers who had to restrain themselves and cripple their program somewhat to make sure it would run under MiNT. Well, that's putting the world upside down if you ask me...

>I have all my Ataris networked here with MagiC and Geneva and it works
>great for my needs. Sharing drives and ftp'ing to/from Windows and so on.
>I have not tried the Samba compatible client yet but it would make it
>even simpler to talk to my Windows pc's.

Oh boy.... never ever repeat that in this newsgroup. You're not supposed to say that anything networked with MagiC works well, you're supposed to be

bashing it, the more the better...

Cheers from Belgium

Hi Janez,

>And what he or his gang (me) are then? If u dont have the basic decency, how
>do u expect any smart reply?

Since when are you so sensitive?
He or (she) and his or (her) gang are the small group of people that smoulder any posting and/or poster who dares to air a negative comment regarding the new wonder drug for this platform: ported apps.
As explained in previous posts I have nothing against these apps themselves, but anyone proclaiming that these apps are just what we've been waiting for needs his head examined. Whatever is left of this platform will be scared away when seeing what that group has in mind...

>U will now also start to bash black ppl or jewes?

Depends... if a black jew would port a GNU app, don't go through the trouble of making it at least a bit user friendly, doesn't even consider to make it SingleTOS and MagiC compatible and to top it of comes bragging about it here, then yes I would bash him.... I'm not a racist, I'll bash anyone whatever his colour or religion :-)

>>You want us to return to the stone age, the only reason given for this so
>>far is that the bunch of people who port software aren't capable of
>>producing a user friendly and more or less good looking interface...
>
>It just so happen that those ppl are good programmers u are ONLY one to
>question their capability! Also Unix and CLI knowledge is prefered and
>WANTED in basicaly all high tech etc dev labs etc.. Stone age? Yeah, esp
>those at universitied and NASA etc... I dont have ANYTHING against u dont
>wana use CLI.. but calling us morons and ppl who does port and a lot of
>those even programm stuff for US (could be for u as well) lamers,

Hey... the pot is calling the kettle names now!! I didn't say that those guys aren't good programmers, it's Frederic, Adam, Lonny and even you who told me so... oh, and I didn't call anyone a moron either.

>stoneagers, not capable is moronic! If u are stupid so much u cant run one
>CLI app which requires ONLY TO RUN IT WIHTH DRIVE SPECIFIED (since in that
>case it check for errors automaticaly OR add very mystic and secret "-a"
>option, "a" as "automatic") dont blame CLI for that.. As u see, i DID read
>dosfsck MANual pages!

Do you call that a manual? have you ever seen a *real* manual? suppose I'm a newbie? About once a week there's a posting here from someone asking help about how to connect a hard disk to his ST. Do you think people like these will enjoy working with dosfsck? they could.... with a decent manual and a user friendly interface, like I said, these apps show a total disrespect for the average user, just like the OS itself, the docs are cryptic and ment for people knowing what they are doing. And that last bit is also against the Atari tradition.

>in 6 years i didnt lost a single file yet..

Knock on wood.... :-)

>Now a question for u: Why even Windows and MAC OS (NT OS/X) turned
>toward Unix and CLI consoles?? Apple after 18 years of GUI finaly got
>that GUI is by FAR not all???

Oh Janez.... are you a stand-up comedian?

Linux, NetBSD, PPCLinux etc.... have been here for years, all what's really happening is that some Unix lovers make a little more waves then they used to, the fact remains that these OS's remain unpopular and are only used by a very small minority. And just like in this newsgroup that small minority tries to create a distortion field.
As for OS X.... that's something Apple is trying to shove up the a*** of Mac users, so far with limited success. Open your eyes, the majority of the Mac users still use OS 9.x, have you ever wandered why? Adobe just released PhotoShop 7.0 and just like most of the other Mac power apps it's *not* OS X compatible....
Apple has a long standing record of releasing stuff the Mac users don't want to touch ; Lisa, Newton, Cube etc... OS X fits right into that list.

Cheers from Belgium
Dennis

Hi Frederic,

>hope you don't mind the subject header change.

No, I've said about all I've had to say in this thread anyway.

>My gosh dude, what do you do other than when you're not complaining and
>not staring at a GEM application?? How about your take some little time
>and convert .TXT or .man/.cat into html or .stg or .hyp?
>How about that? everybody will be happy, you included.
>Be useful somewhat.

Oh but I do...
I bet I converted more *.stg, *.udo and *.txt files then you've ever read. But there are a couple of conditions: I'm not going to waste time on something I don't like myself and secondly it has to be something which is usefull to the greater part of the Atari community.
Suppose I would make a brilliant ST-GUIDE file of the dosfsck app, then who on earth is going to read it? the average Atari user will never touch the program the way it's now, and the people who are using it don't need the HYP file, so it would be just a waste of time.

>You don't even need to be a coder, as someone already has created a
>conversion tool to make the process a little easier. How about that?

Another waste of time.... ever heard of UDO?

>>the only reason given for this so far is that the bunch of people who port
>>software aren't capable of producing a user friendly and more or less good
>>looking interface...
>
>whatever dude.
>It wouldn't be porting anymore, it would be re-writing or writing extra
>code. Different matter here.

And this ladies and gentleman is the end of the discussion... tune in next time when we'll discuss another brilliant topic.

In my unmodified Falcon, those pins are not used by the connector of the
keyboard. Do you know which rev.(s) use them ?

Bye,
/Pascal/
